I have the perfect location to conduct this study too :-). There are seriously more bugs/per square inch in this place during June and July than I have ever seen in my life. If anyone wants to check it out, you'd be welcome.

I have heard that too, and to some extent it does work. Though I think it would have to be over a period of time before your body totally absorbs enough to make you taste awful to the mini vampires.

It's been standard practice among the snake eaters(special ops military) to take mega doses of vit. B before patrolling to reduce attraction of blood sucking insects. I've never tried it myself, though a few of my acquaintences swear by it; maybe one of the more experienced members can give you an idea of dosage and actual effect.

Howdy,

I believe Barent has had pretty much the same experience I've had.

>I think that my tabs are 500 mg. I take one a day for 5-10 days before  
>moving to the field.

My recollection of our SF "Hot-Wet Environment" prep kit instructions included "Thiamine, 500mg" to be taken at night 14 to 30 days before operations and continued daily. DEET "Jungle Juice" was also a part of the kit though not used extensively by us because of the odor (Charlie's nose could smell it even over the stink of their "nuoc mam") and the effect it had on the plastic parts of an XM16 "Mattel-A-Matic".

Side effects were minimal, if any. We had other things to think about. There was discoloration of the urine and a "need to pee" sensation but I attribute part of that to the Amphetamines they shoved at us. (Black beauties, 30mg biphetamines! Whoopeeee! I'm shock proof, bullet proof and anti-magnetic!) Perhaps the Amphetamines repel bugs?

The mosquitoes were the "Eat him here or take him with us" variety. I might add that the insects would land, start to "bite" then take off. The natives did not use DEET or anything else that I recollect. Something in the genetics or their diet provided protection. After the first six months in country I was pretty much unmolested by the little F-----s.

Not science, just observation.

>snipped IAW list protocol.  
> give you an idea of dosage and actual effect.

I think that my tabs are 500 mg. I take one a day for 5-10 days before moving to the field. I don't know that mega-doses over a shorter period are effective. I have used this as the sole anti-insect tactic and it has worked in summer, in the piney woods, where others were soon on intimate terms with Charlie Chigger and Tommy Tick and I hnever made their acquaintance.

I know that Andre doesn't want testimonials but... I do the following when going to the field: wash with fragrance free soaps, take vitamin B supplements, up my garlic intake, get a haircut. When I get to the field I use a DEET product (although I would prefer something that doesn't eat the plastic watch case). I have virtually zero problem with insect bites, including chiggers. We have found that each of these step in and of themselves is effective and just combine them to work pest free. Yes, Avon's Skin So Soft does work to cut down on chigger bites (depends on how applied). Not altogether primitive but makes that long wait in the ambush so much less miserable.

I have found another effective pest treatment to be treating my clothes,  
in particular my cuffs and waistband with Permethrin. It is sold in  
army surplus stores and I think OFF has a commercially available  
product. It lasts for weeks, does not come in direct contact with my  
skin, and when I have used it, I have never had a tick or chigger  
problem when those around me are clawing at their skin like maniacs.  
Sure it isn't primitive or available in nature, but damm if it does  
work!

Kevin

Where I live in Northern Wisconsin, I have found very little other than  
a headnet that helps at all. I don't use DEET products, especially not  
on my skin, but the kids I work with do and it does very, very little to  
keep the little buggers off. Like many here on the list I have tried any  
and every natural repellent I can find or make including:

- strong cedar teas
- Bracken fern head coverings
- strong smudges with cedar, balsam fir etc.

Nothing works for very long, if at all.

The question of diet is interesting. Plantain seeds (*Plantago* sp.) has a  
high quantity of B vit. in them. A friend of mine was told by an Ojibwa  
Medicine woman to eat half an inch of the seed stalk every day. This  
recommendation was based on his extreme allergy to bee stings and his  
seeming ability to attract them constantly. Since taking this remedy he  
has not had a single bee sting and he says mosquitoes just don't seem to  
bother him as much either. One factor is that he lives in southern WI.  
Folks down that way have never encountered mosquitoes and biting flies  
like they find when they come north, especially like they were this past

year. My personal experimentation with plantain seeds is that it probably helps some, but not enough to really make a serious dent in things. I eat a fairly clean diet, to, that is high in wild edibles, especially during peak mosquito time. I have heard different instructors say that natural diets help. So far I have not found that to work entirely.

I believe that in one of Tom Browns books he mentions the use of plantain and a couple of other plants as insect repellents. when I am out hiking I often eat plantain as a trailside nibble. my hiking friends have been convinced that the vitamin-B works, as they are always getting bit. I'm not sure that it is related but I also have less reaction from poison oak. Peterson feild guide to medicinal plants has some good information on plantain.

Reminds me of a question I had... I was experimenting with making pemmican a while back, including various "extras" along with the dried meat and rendered fat; e.g., cranberries, blackberries, raisans, and nuts. In particular, I had a batch with ground up peanuts... Someone else who sampled that batch opined that, while tasty, it would be a bad food for in the wild, since "eating peanuts attracts mosquitoes." Anybody else heard that? Believe it? While I don't eat that many peanuts, the mosquitoes (and chiggers and, apparently, most annoying bugs) like me enough as is without encouraging them more:^).

Note there is also Flintknapping The Art of Making Stone Tools by Paul Helweg, a 110 page booklet available from:

Errett Callahan, PhD, Dir.

Piltdown Productions

2 Fredonia Ave.

Lynchburg, VA 24503

Thanks for the knappers web page reference.

With reference to all topics discussed here, it is a pleasure to communicate with like-interest people, especially in the somewhat obscure area of primitive skills. I just subscribed last week and am glad I did.

Do not do that!! You can be hurt bad!! Folks smater than I will be telling you why vary soon.

Please go and buy this book The Art of Flint Knapping, By D. C.

Waldorf. It will cover the basics, such as tools, raw materials, percussion, pressure, and indirect percussion flaking techniques, as well as advanced

theory and practice. You may be able to get this book at the Library. This

book was of great help to me when I first started and still is. Also go to

this URL <http://www.ucs.mun.ca/~t64tr/knap.html> This is the Knappers

Anonymous Homepage you can get all kinds of information on Knapping, such as

where to get the tools for knapping what is safe to do and what is not safe

to do. Do not let your students knapp until you have checked all of this

out. There are things you must do to make this a safe hobby. Here is another

homepage to check out. This is called the Knapper's Corner it too is a good

homepage <http://www.eskimo.com/~knapper/> Good luck

Gary Lowell

HERE WAS MY ANSWER TO THIS PERSON:

I am glad to answer this question. The answer is that this is only a myth. It is not possible to control the shaping/knapping process in this

manner. As near as I can figure this comes from an old Edgar Rice Burroughs, Tarzan novel. Stone tools and points are produced from many types of stone, including obsidian. They are produced by striking the stone with a billet or hammerstone in such a way that the energy travels through the stone and causes the stone to break off predictable, controlled flakes. The tool is further finished, depending on the tool, by using an antler tine or copper wire mounted into a handle as a pressure flaking tool. This is a very simplified explanation.

For more details I can recommend some classes from people who teach this process known as flintknapping. I also recommend the following books:  
Flintknapping Flashcards by Errett Callahan (Piltdown Productions)  
Flintknapping: The Art of Making Stone Tools by Paul Hellweg (Canyon Publishing Co., ISBN: 0-942568-05-2)  
The Art of Flintknapping by D.C. Waldorf

I also recommend the following teachers:  
Errett Callahan, Piltdown Productions, 2 Fredonia Ave., Lynchburg, VA 24503

Errett Callahan specializes in and conducts workshops in flintknapping, primitive skills, archery, etc. and sells stone knives, flintknapping supplies and a starter set for the beginning flintknapper, complete with instructional flashcards. Catalog available. He is very renowned worldwide as an exceptional experimental archaeologist. He is founder of the Society of Primitive Technology.

Jeff Holshouser, 8535 Bringleferry Rd., Salisbury, NC 28146, Phone: (704) 639-9082

Jeff teaches some excellent workshops on flintknapping, especially for those just starting out in flintknapping. He also collects artifacts and sells casts of originals and will do other replication.  
Flintworks, Scott K. Silsby. Rt. 1, Box 2426, Front Royal, VA 22630, Phone: (703) 636-4824

Scott is the best teacher and tool maker, when it comes to greenstone tools. He also teaches workshops in flintknapping, bow and arrow making and sells greenstone and greenstone tools.  
Boulder Outdoor Survival School, Inc., P.O. Box 1590, Boulder, CO 80306, Phone: (303) 444-9779

B.O.S.S. has much to offer in primitive and survival skills workshops from a week to 27 day long hands-on training. Write for a schedule of classes and products they have available. They are also a good resource to connect you with some particular craftsman, book or resource you may be having trouble locating. Dave Wescott is director and is well known for his contributions and skills in primitive and survival technologies. He organizes Rabbit Stick Rendezvous and is editor of the Bulletin of Primitive Technology.

Barry Keegan, Pathways School, 6 Heather Lane, Elmsford, NY 10523, Phone: (914) 592-8961

He and his partner, Anthony Follari are two of the most skilled people I have met. They communicate well and their experience in the field is apparent. Write for a full schedule of their classes.

The following organizations and newsletters are also excellent resources:

Michigan Flintknapper's, Robert Love, 8185 Kiowa Trail, Pinckney, MI 48169

A group of flintknappers and primitive technologists that meet

regularly and hold annual events. They are donation supported. To maintain membership you must be actively contributing to the group in some way or by contributions, suggested, \$10.00. They have a fine news letter for all members and contributors to their group.

Great Lakes Primitives, George Hedgepeth, Editor, G-3450 South Linden Rd., Suite 119, Flint, MI 48507

Newsletter on various primitive skills and activity focusing on activity in the Great Lakes area. \$10.00 per year

Bulletin of Primitive Technology, Society of Primitive Technology, P.O. Box 905, Rexburg, ID 83440, Phone Voice/FAX: (208) 359-2400

More than a magazine, the official bulletin of the Society of Primitive Technology. The most highly technical, yet understandable, magazine on various primitive technologies I have ever read. Contains articles by all the big names in these technologies. Join the Society and order their back issues while you can at \$10 per issue. Free classifieds for members. (\$25.00 year). Subscription price includes annual PrimitiveTechnology Newsletter.

ALSO CHECK OUT MY HOME PAGE BELOW FOR OUR CLASSES, ANNUAL EVENT AND SOME GREAT LINKS!

I just found a great way to "keep it clean". I got one of the plastic kiddie pools and placed a chair with only the front two legs inside the pool. You can then sit in the chair and have the pool catch all of your tailings. When it gets a little full, just fold the pool a little, and funnel all the waste into the trash. It works great. The pieces are caught by the edge of the pool instead of zinging off a tarp as they often do.

I would also like to push the Whittaker book. I've been knapping since I was a kid, but I could never quite get it down. Sure, I could whittle a stone into a pile of flakes in no time, and maybe have some sort of crappy looking tool at the end. But a couple of weeks ago I finally found Whittaker's book at Barnes and Noble Book Stores. I've read it about half way through. My job (as an archaeologist) currently requires me to do little more than watch big machinery demolish old buildings. I then go look at the ground to see if anything is below them archaeologically. Therefore, I sit and have a lot of free time. After reading about half the book, I sat down at work and began putting it into practice. I am happy to say that I now have a small arsenal of points that, for me, are pretty damn cool. I've struggled with knapping for about the past ten years off and on, and then after reading that book, BOOM, I could finally do it!!! I'm not claiming to be "GOOD", but I'm a hell of a lot better than I was in the past ten years. Even my friends and family were amazed that I actually had made the points that I showed them. Sorry to ramble, but to anyone that is having a hard time or just beginning to knap, I highly recommend Whittaker's book "Flintknapping: Making and Understanding Stone Tools". I'm sure it will help. If Santa leaves that scanner under the tree this year, I'll send in a before and after testimonial to the Gallery. That is how I came across the pool idea above. Since I've finally been able to do it, I CAN'T STOP!!! My arms and hands are sore! OK, enough raving.

Peace,

Jim, good pressure flaking post!

I would also like to recommend a video that i purchased about 6 months ago from Craig Ratzat from Oregon. It's the best one i've seen so far.

anyone interested can contact Craig at 541/747-1399. The video is called "Caught Knapping".

Standard Disclaimer: i don't get any kickbacks/etc from Craig.

Good Knapping.....

Bob, Edgar Rice Burroughs went into great detail in his Tarzan novels to describe how Tarzan heated the flint in a fire then sprinkled water on it to fracture the stone..... this is FICTION as the saying goes .... do not try this at home ...Heat treating is at best very tricky ITis done by buirying the matieral in dry sand UNDER a fire pit,.....approx. 4 inches of sand then the stone then more sand compressed on top. on top of this you build a fire allow it to burn for a whole day, then let it go out on its own. After it is toatally out, about another whole day ,remove the stone and you will find it is like christmas time , you never know what colors the heat treating has brought out. Expirement with different sand depths , and different types of flint, as well as how long to keep the fire burning or how long you let it cool before removal from the sand . Different kinds of rock require different amounts of heat to successfully heat treat , for example... Ohio flint heat treats at around 350 degrees.....any hotter and you can ruin the matieral, while Brandon flint from Europe requires a much hotter fire I believe it is in direct correlation to the amount of silica in the matieral as you know flint is very high in silica. Quartzite does not heat treat very well to get large flakes from "ZITE" as we call it you have to get even more primitive. When we want to work zite we go to the

Burlington Vermont area where there is some of the best , most glass like zite in North America then we get crude, by carefully picking up 100 lb boulders and smashing them down on other boulders to remove large spalls. In this manner we have produced 16 inch spear points no thicker than 3/4 of an inch. Give these methods a try you will enjoy the results much more than having an exploding rock send a shard through your skull. If you would like any more info you can write to ... Thunderpaw at this address . keep on bustin rock.

Hi Dr. Bourbeau,

First I must say my mother's mother's maiden name is Bourbeau. Born in Quebec. First French ancestor settled in Trois Rivieres. I do have some geneology. We most likely are cousins.

Consulted with my husband the knapper. He said there are flint and chert deposits in Canada that can be used for knapping in survival situations. There are problems with cracking if it is obtained above the frost line. Heat treating of these materials alters the structure and color in some cases for easier workability. Over an open campfire it is trial and error. After spalling off your flakes from the original piece dig a hole below your fire. You have to use 4 inches of dry sand between layers of flakes. Do small batches. If it cracks you need to go deeper with more sand between fire and first layer. If still hard to work bring layer up closer to fire. I don't know of the other knappable materials in Quebec. Tim Rast may be able to help you with that. Can't think of any other Canadian knappers.

If you have any specific questions my husband, Joel said he would be glad to answer them. His techniques are suited to wilderness survival as the only tools he uses are stone, antler, and copper. No power tools.

Hopefully next spring we will be going to Kanasatake to visit friends. Maybe you could come watch him demonstrate there.

Here are some more knapping sites if anyone is interested. This first one is not quite finished, but the guy knapped with Crabtree, so he must have some pretty good knowledge on the subject. Once it is finished, it may prove helpful to many on the list.

<http://www.ucalgary.ca/~dthanna/flintknap.html>

<http://www.lib.uconn.edu/NativeTech/stone/index.html>

Also, concering posts that inquire about knap-ins, Whittaker's book has a long list in the back of what appears to be yearly knap-ins across the country. If anyone is interested that doesn't have the book, I'll post them (just as soon as I complete my FINAL for my archaeology theory class). Let me know if you are interested.

Nothing runs contrary to nature,  
Only to what we KNOW of nature.

Dave,

It depends a great deal on many factors such as type of stone, platform preparation, type of precursor etc. Perhaps if you can get me some more detail I can help.

On large material, over say 30 lbs, I use a 2.5" x 9" piece of copper that weighs about 15lbs. I do not have to use much speed in the strike, but the mass of the heavy billet produces a much flatter spall than a lighter billet with more speed.

Hope this helps.

While out enjoying the first good weather of 1997(tossing my rangs, of couse), I shared time with a some local uni. students. During the course of the afternoon, we shared a few outdoor experiences. I mentioned this skills list and things I had learned.

Upon the mention of fire making, one fellow said that he had discovered FOX FIRE and that he had gathered enough to read in the dark....While I have certainly heard the term "fox fire", I'd never known its properties.

Sounds like something useful for this list.

My new friend said he often found it under pine knots, in loamy, damp soils.

Any comments?

Fox Fire is the luminescent rotting wood often found in the forest, at least here in the south. I have often seen it, sometimes in quantities large enough or bright enough to be useful for performing light requiring tasks, but not often. It is not a fire starter, and I have never heard it referred to in reference to actual combustion. You may have heard of the Fox Fire books (a series of 10 I think) which are interviews conducted by high school students, mostly of "experienced" people in the Rabun county area of North Carolina. I have the books, great info and reading, ISBN: 0-385-07353-4, 0-385-02267-0, 0-385-02272-7, 0-385-12087-7, 0-385-14308-7, 0-385-15272-8, 0-385-15244-2, 0-385-17741-0, 0-385-17744-5, and 0-385-42276-8. The series (of books, I think that there were magazines or articles earlier than that) started in 1973. Unfortunately, the editor and founder of the group was convicted of child molestation and ended his relationship with the group 2-3 years ago (I think).

Long post but I could talk more about the books, as to your original question, I think that foxfire (correct spelling) is interesting but of limited practical use.

Foxfire is methane gas, a naturally produced flammable gas also known as swamp gas. Some modern production of this is popular in China and was once used to power cars in the U.K. Generators can be easily made, but mainly with modern materials. It was the source of gas power in the movie RETURN TO THUNDERDOME.

James E. Burdine wrote:

> snipped IAW Andre's instructions.

> Foxfire is methane gas,

I thought that was swamp gas!?! Please elaborate. Is this a dialectual (sp?) difference? Not in my experience and I have lived in CA, TX, WV, VA, KY, FL and have family and friends in every other state, Canada, Australia, England, Germany, etc... Foxfire has always meant luminescent, rotting wood to us. The luminescence created by the little living things (a fungus I believe) living off the dead wood. I will say that about the only place I have seen it is in the the southern US.

According to the initial volume of "Foxfire" it is "...a tiny organism that glows in the dark and is frequently seen in the shaded coves of these mountains."

Sorry for the disjointed post but I am writing on the fly, grabbing books as I come to a point requiring documentation. There are other names for swamp gas, but I have never heard it referred to as "foxfire".

Told you I could be blunt.

The main one I know is alovera. Also good for burns. I'll keep looking.

Hi everyone,

Balsam Fir is probably one of my all time favorite natural remedies, which is great because it grows all over the place near me. The primary section of the tree I use is the pitch which has a natural antiseptic and can be used on cuts. It works better and heals faster than any store bought medicine I have ever found. The biggest use, though, is on burns and blisters. I have seen it heal the nastiest hand-drill blisters sometimes overnight and I've proved this over and over to people. I first learned about the burn properties of Balsam pitch from a synopsis of a doctoral thesis put out by a woman who, in addition to being and M.D. was apprenticed to an Ojibwa medicine woman in Michigan. I've since tried it under numerous circumstances from bad blistering to severe first and mild second degree burns and have found it soothing (which is important for a burn remedy) and a quick aid to healing. If anyone is interested I can post an address where this M.D.s piece can be purchased.

Mark

Actually there is a very good use for maggots that does not involve food. If you have a small area of infection maggots are quite good to debride(eat) the sick flesh out. Alegendly they won't eat healthy flesh,

only dead purulent flesh. Can prevent a small problem from becoming a bigger problem.

Exactly true. I know from experience what it's like to grow maggots on one's arm. As odd as it seems our medical training included instructions for protecting maggots on an open wound. As I remember (perhaps someone can check this) they excrete (secrete) a chemical called Alantoin. This slime is used as the basis of some cosmetics and skin care products.

" EEEEEK! I can't eat that!" "Hell then, just rub it's shit on your skin!"

In addition to reducing scarring, the substance is also supposed to reduce the chances of infection through some sort of antibiotic action.

There are some insect larval infestations that I find much more unpleasant. The Bot fly larvae is a good example of that.....

On that note..... I'm going to journey into the kitchen where Karen and I are preparing a wonderful romantic dinner free of maggots, road kill, butt devils exploding marshmallows (great story!) and other wonders of the primitive sciences. Till the 'marrow....

Peace,

Ron Hood

I had that experience, only with fingerling fish (trout, I think) while fording a river (trying to get over to a hotspring, of course). I had a lingering wound I don't want to describe and was surrounded by a school of these little fish, busily pecking at my arm. Felt odd but didn't hurt. Healed very rapidly after that. Might want to go down to the fish farm in the future.

Chris

I'll quote a post from a few days ago to this list:

On Tue, 14 Jan 1997, Tom Elpel wrote:

# USNEACEAE

# Alectoria-Black Tree Lichen\* The black tree lichen is stringy and "moss"  
# like. Montana Indians washed and soaked the lichen, then cooked it for one  
# to two days in a steam pit. The cooked lichen was eaten or dried and  
# powdered and used as a mush or thickener later. It is reported that  
# Flathead Indian families ate 25 pounds of the lichen each year (Hart).  
# Evernia- The plant is edible (Sturtevant). A thick tea is used on running  
# sores (Murphey).

# Letharia-Wolf Lichen\* This bright yellow tree lichen contains a highly  
# toxic acid. It was once combined with animal fat and nails and used in  
# Europe to kill wolves (Vitt). It is also used as a dye plant.  
# Usnea-Old Man's Beard\* The lichen is boiled for use as a dye (Gilmore).  
# It is used medicinally as an antibiotic (Klein). (Usnea is a light grey  
# color. Use the "rubberband" test for positive identification: break the  
# stems and inside you will find a white, rubbery core that stretches a  
# little like a rubberband.)

> I live in Western WASHINGTON, USA some places around are like swamps.  
> The moss I'm referring to usually grow on tree limbs near streams and

> when I did, I don't want to wipe with some poisonous moss stuff.:)

Hard to tell from your description, but I doubt it's sphagnum, which is  
the bogforming moss of the northern forests. The color fits, though.  
Anyone familiar with the one and can help out on the possible ID?

/Par

I was living in WV as a boy when I first heard of this. Came in handy a  
time or two. Works on small wounds even big bleeders, don't know that I  
would try it on a sucking chest wound though. I thought that it was used  
also by the non-natives in upstate NY (where my family is from and from  
or through whom I heard of the technique).

I was also taught to lick my own wounds to encourage clotting! Worked, I guess, at least I didn't bleed al over everything. Guess you could say I was a bit accident prone and always playing with sharp things.

Tom's right, I have found that any rendered (or unrendered, for that matter) animal fat works for lip balm, but it seems to me that plant juices are only added for flavoring, so many would do, or they could be dispensed with entirely. For example, I once used squirrel fat (just wiped the peeled skin on my lips). Lip chapping is indeed a major discomfort on survival trips, and lip balm is part of my everyday pocket gear. I'd love to know if any non-animal sources exist. I may have

read (not sure, worth a try) that balsam fir (*Abies balsamea*) sap from bubbles was used. Anyone else on this?

Hi Jennie. Tom Brown says (\*Tom Brown's Guide to Wild Edible and Medicinal Plants\*, p. 99) that Chickweed juices (from the leaves I think he means) added to tallow (rendered animal fat) makes a good lip balm. I haven't tried it.

Actually, Larry Dean Olsen taught this long before Ol' Tom put it into his book. I believe Tom took a few lessons from Larry back in the early '70's. That explains why so much of his material is nearly identical to Larry's. I think Larry maybe "Stalking Wolf".

There's another technique, one that I hesitate to mention... but it works. Rub some brown steamer on your lips, I promise that you won't lick them after the first time. Your lips won't get chapped.

Peace

>I once used squirrel fat

I know for a fact that MINK OIL is one of the very best fats for skin care. Will give some protection from sunburn, has a slight anesthetic

effect for cuts, bites, burns, ect., is very healing.

Probably other similar fats are effective(turtle fat is claimed to be equal to mink fat...but who want to wear a turtle shell coat? :) ).

Tea Tree oil is an excellent plant balm. There are several brands on the market, as well as different grades and qualities. The very best is made from the Australian MELALEUCA ALTERNIFOLIA. Was known as "The Aussie penicillin" in WWII.

In the highest grade, melaleuca oil is many more times effective than aloe for burns, bites,ect.

Mink oil, comes in various grades. BUY THE BEST, it's expensive, but does not go bad. And it is avail. in 100% pure grade.

Us city boys, do know some stuff:)

Hi everyone,

Balsam Fir is probably one of my all time favorite natural remedies, which is great because it grows all over the place near me. The primary section of the tree I use is the pitch which has a natural antiseptic and can be used on cuts. It works better and heals faster than any store bought medicine I have ever found. The biggest use, though, is on burns and blisters. I have seen it heal the nastiest hand-drill blisters sometimes overnight and I've proved this over and over to people. I first learned about the burn properties of Balsam pitch from a synopsis of a doctoral thesis put out by a woman who, in addition to being and M.D. was apprenticed to an Ojibwa medicine woman in Michigan. I've since tried it under numerous circumstances from bad blistering to severe first and mild second degree burns and have found it soothing (which is important for a burn remedy) and a quick aid to healing. If anyone is interested I can post an address where this M.D.s piece can be purchased.

Mark

I haven't tried any of this (the voice of inexperience), but Jewel weed strikes me as a good emoliant for lips. Also cactus juice, aloe, dodder, good old cattail root paste, english plantain is good as a poultice. Maybe trail celery (thistle). I'm thinking mostly succulents.

Merv Martin wrote:

>One of the basics to carry with you is the bark especially the inner bark (cambium) of the willow. White willow seems to be the best, but all have a chemical called salicine. It's the natural form of aspirin (aceyt1-salicylic acid). So whatever you use aspirin for you can substitute wilow bark for. The leaves work too but are a different strength.

I've used willow bark tea for aspirin on survival trips and it works, but may irritate your stomach (no buffers like in store bought aspirin). I would like more information on preparing this too. Is it really the inner bark that works or all of the living parts? What strength does the tea need to be to correspond to an accurate dosage? Is there a way to remove the bitterness? Are there other ways to ingest it other than tea?

AndrÈ

PS It does not cease to amaze me how many interesting subjects come up on this list! By the way, thanks everyone for renaming subject headers to reflect content of message.

I'm not sure of exact doses. I usually make an infusion (a tea). For a mild sedative a bundle of young tiny branches steeped in boiling water is very soothing. You can further concentrate it by boiling the inner bark and branches, inner bark seems to be strongest. The more you boil down the stronger it becomes. You can also make a tincture by crushing and cutting up the inner bark, placing it in a bottle of ingestible

grain alcohol, placing in a dark place and shaking it every now and then. The shelf life is much longer and it is more concentrated this way and usually only requires a couple of drops, wait and see if it helps and give yourself a couple of more drops as you need it. I have also just chewed the inner bark. It is very bitter, but somehow a satisfying sensation. It takes the edge off of minor pain like muscle soreness. An infusion can also be rubbed on the skin to soothe muscle soreness and can be gargled for throat soreness.

I have not heard of dogwood used for pain relief, however, I do know it contains conine, a substitute for quinine. It was used extensively during the Civil War (U.S.). As far as researching how many plants are good for pain relief, Chris gave an excellent reference that is easy to use: The Ethnobotany Cafe, here's the address, in case anyone missed it:  
<http://countrylife.net/ethnobotany/>

Heya all,

First let me introduce myself a little. My name is Greg Biddle, I'm an archeologist, currently working in Juneau AK. I have worked all over quite a bit of the western and midwestern US. I have been flintknapping for about 7-8 years and have been interested in / practicing 'primitive' skills since my uncle taught me how to shoot a bow, bareback from a horse, and how to cure squirrel pelts with table salt (Sorry Mom!?!). I am really enjoying this group, although I was getting a little worried about the 'fish bombing' thread!!

Andre wrote:

One way I've found to 'buffer' the willow bark is to add a little bit of mint (especially peppermint leaves) to the tea - it also makes it taste a LOT better. Mint also works as a stomach-soother by itself. And I have also used red willow bark with the same effects. As for dosages, I usually follow the 'intuitive' rule of about one cup of tea every 4 hours or so until the problem goes away. And I have heard that willow bark can be smoked to ingest the aspirin-like stuff, although I imagine that would just cause throat pain instead of stomach pain! And the bark can be chewed - same stomach and taste problems, but this does work especially well for toothaches (yeah, go figure!)

Well, thanks for letting me put in my 2 cents - I'll be watching closely, as I think there is lots coming from this group for me to learn.

Greg

By the way, how many do we have in  
>the group with knowledge of medicinal and edible plants? Please step  
>forward, so we can pick your brains from time to time. I do OK with  
>plants and know enough to survive, but there are so many I know that  
>know so much more than me.

Got info and can dig up a few for ya. It'd be easiest to set up categories  
for treatment. Like burns, breaks, upset stomach, aches and pains...

\_DO\_ be careful, a plant called foxglove grows in North America. It's  
generic name is Digitalis (specificly Digitalis purpurea). Note the name  
Digitalis. Sounds like heart medicine doesn't it. It's the source of  
digitalis. That's just one.

One of the basics to carry with you is the bark especially the inner bark  
(cambium) of the willow. White willow seems to be the best, but all have a  
chemical called salicine. It's the natural form of aspirin  
(aceyl-salicylic acid). So whatever you use aspirin for you can substitute  
willow bark for. The leaves work too but are a different strength.

Now, be careful collecting the inner bark, If you cut away the cambium  
layer all the way around the tree (called girdling the tree), you'll kill  
it! That's it's blood system.

As far as dosage, I need to dig for some definitions and will post after

Christmas.

Speaking of that Merry Christmas to all and to all a prosperous New Year.

Merv

Jewel Weed is the best remedy for easing ivy itch. Just take a stalk, split it to expose the succulent inner and swab away. I have even made a preserve of isopropal alcohol and jewel weed juice (ground in a food processor) which lasted a couple of years and worked until it was used up.

I am not even sure I've seen poison oak! Just try to go out and try to find some plant you've never identified/not familiar with. Like looking for a needle in a river bank.

>a sensitivity that reveals itself on further exposure.  
>My father was once immune, so he was given the task of cleaning  
>out a big patch of poison ivy. His next exposure caused very  
>severe illness.  
>

According to MEDICINE FOR MOUNTAINEERING by James Wilkerson, MD 4th Ed, 1992:

"Desensitization for poison ivy has been tried, but the side effects are as bad as the rash. No desensitizing agent has been approved by the Food and Drug Administration."

And according to Paul Auerbach, MD in MEDICINE FOR THE OUTDOORS:

The rashes of poison ivy, poison sumac, and poison oak are caused by a resin (urushiol) found in the resin canals of leaves, stems, berries, and roots. The potency of the sap does not vary with the seasons. Because the plant parts have to be injured to leak the resin, most cases are reported in the spring when the leaves are most fragile. Dried leaves are less toxic; particles can cause a severe reaction on the skin and in the nose, mouth, throat, and lungs."

BTW: I have used a wash made of jewelweed (*Impatiens* sp.) leaves and stems crushed in water on my skin when I think I have been exposed to poison ivy with apparent success. I have used the juice from the stems right on small poison ivy skin eruptions when it just starts to itch and the rash disappears.

> Seems like one of the old homeopathic medicines was poison ivy, but  
> in very dilute form.

Homeopathic remedies assist the body by using a \*\*\*VERY\*\*\* diluted substance that, taken undiluted, would produce the very reaction you are trying to heal. (!) I've got a Homeopathic remedy (never homemade, always lab-made) for Poison Ivy/Oak. Label says: RHUS TOXICODENDRON, CROTON TIGLIUM, XEROPHYLLUM. The scientific names they use may be outdated since Homeopathy has been around for 100 years. What are those last two anyway (in english/common name)? No one quite knows how they work, yet there is much research that documents its effectiveness.

The only problem with self-diagnosis (I use Homeopathic remedies at home) is that you often have to be quite specific with the remedy. Just because you have an itch/rash doesn't mean one remedy will cure that itch/rash (unlike cortisone which, I guess, would be effective for most any rash). You have to be fairly exact in your typing of a

problem, so you can match the appropriate remedy. On the beneficial side: If you take the 'wrong' remedy, you will simply not experience any change. Also, you could swallow an entire bottle of any remedy and would not experience any negative side-effects.

A common Homeopathic remedy I use is Arnica montana (or Leopard's Bane) for sore muscles and bruises. It can be taken internally in pill form and/or rubbed on externally in gel form.

Love & Health,  
Rees

Croton spp (at least according to my books) now has the genus name of

Eremocarpus, in the Spurge (Euphorbiaceae) family. The common name for the genus is doveweed or turkey-mullen.

Xerophyllum (in this area X. tenax) has the common name of beargrass. It's actually in the lilly family. It's a cool-looking plant that often grows in the higher areas. It has a bunch of basal leaves and sends up a tall shoot with a cream-colored flower cluster. (Kind of like yucca but with a more compact flower head and leaves that aren't used as a weapon.)

I was reading an old issue of bulletin of primitive technology today. It  
had a note about using the crushed green leaves of plaintain to cure  
poison x rashes. It stated that they totally eliminated blisters, rash,  
and itching within ONE HOUR!

Hello all. i had just replied to another reply about this topic - re:  
using plaintain leaves on the rash. I also have another interesting  
tidbit. Nightshade, when crushed and mixed with alcohol creates a  
topical analgesic similar to Zostrix, according to the article I read.

Does anybody know of some remedies for Nettle (*Urtica* spp.) stings. I know Jewelweed (*Impatiens capensis*) is a good remedy, but it does not grow in my region. I have found that the rubbing root of the Nettle plant directly on the affected area is a good temporary cure. The problem is that about 15 to 20 minutes later the irritation comes back. Any information would be greatly appreciated.

Plantain also works for stinging nettle. I have heard that the underside of a fern  
(don't ask me what kind) works when it is fertile (ie, has those brown dots, pollen?,  
on  
the underside). Howz that for a non-technical, heard-it-through-the-grapevine  
explanation?

Love & Health,

Rees

Plantain (*Plantago* sp.) is also reported to draw the toxins out of a recent exposure to poison ivy. However being one of those lucky folks that so far has avoided the plague (although I have been in contact with it many times) I have yet to try it on myself. I have used this and a few other PI remedies on a bad reaction to mullien (blisters, itching etc. It looked so similar to PI that a doctor diagnosed it as such), obtained while working on handdrill (mullien is indeed an irritant to some, however it seems that the more I work with it, the less severe my reactions are, which is contradictory to what I know of PI). In this case I used plantain, jewelweed and apple cider vinegar and it cleared up the affliction in a couple of days. I have since used the apple cider vinegar on a number of skin infections with great success. The most recent situation was a persistent fungal type infection from tanning slightly over ripe deer hides that was completely healed with no recurrence by vinegar after everything else I tried failed.

Just a comment, finally, on jewelweed and my knowledge of how it works. Supposedly, it is most effective when applied prior to exposure or immediately after. It supposedly works to neutralize the active irritant. A friend that has very bad reactions to the stuff claims that jewelweed can't touch his PI after the symptoms have appeared.

I have also heard of elderberry inner bark being an effective PI remedy, but have no personal experience with it. Anyone tried this or know about it?

Tannin is also extremely toxic, which is why eating untreated (leaching or boiling out the tannic acid) acorns is a big no no. I know that there are other astringents found naturally. Witch Hazel is a great topical astringent, but I have never heard of anyone using it internally. Some of my books list common plants such as Uva ursi, nettles, self heal, wood betony and wild geranium as all containing some astringent properties but I have no further information on actual content. Michael Moore suggests plantain, sage (Artemesia sp. certainly and not Salvia), self heal, amaranth, wormwood, bistort and a number of other plants I have not worked with as being diarrhea remedies. I have used all of these but wormwood internally myself both as food and as medicines. Sage was suggested to me for a number of ailments by an Ojibwa man I know. It is also a powerful diaphoretic (promotes sweating) so it sort of acts like your own internal sweat lodge too :-)

Happy healing :-)

Wow! You have some powerful and persistent nettles out your way. My experience is that the irritation tends to go away on its own untreated within a half hour, however, when I don't want to wait that long I use Plantain (*Plantago* sp.) in a poultice form and it usually helps lessen the irritation in a couple of minutes. To make a poultice either chew up a leaf and apply the resulting mass directly or grind the leaves up with a mortar and pestle or a couple of rocks until the same kind of pasty consistency is obtained.

A word on Plantain. I know of an ethnobotanist at the UW Milwaukee who argues that Plantain major is actually Native to this continent, a notion that is certainly disputed (one of the common names for this plant given by Native tribes was "white man's footsteps", so named

because it seemed to spread through the continent along with the European invasion). He argues that there are two varieties of the plant-one that is native and one that is not. The native variety has a redish-purple tinge to the base of the leaves, the non-native variety is white. He also argues that there is evidence of Native people in my neck of the woods (WI) using the native Plantain for food and medicine prior to white contact. Anyone out there run across any information on this?

This agrees with my experience. I've used poultices, distillate, never had much success with jewelweed on poison ivy, but I'm not sure I've ever applied it quickly enough.

I am skeptical of any herbal cures for poison ivy. I've never had any external cure work well, not even cortisone applied externally, liberally,

and frequently. Ingested cortisone, starting at 50mg/day, tapering off to 10mg/day in a week, is the only cure I know. But doctors are reluctant to prescribe cortisone.

Disclaimer: I am not a doctor.

Sounds like possibly Cinnamon Fern, although I have never heard of it being used this way. Maybe so though (BTW they are spores :-)).

Topical corticosteroids are available in a wide range of potency. The Over The Counter preparations are the weakest. The more potent forms are pretty effective topically, but can cause skin atrophy (thinning) if used long enough. Some parts of the body are more susceptible to this than others. That is why doctors are somewhat reluctant to prescribe the more potent

forms.

Disclaimer: I am a doctor. :-)

For the record, I have also used jewelweed or touch-me-knot as an  
antidote for poison ivy. Works better than anything you can buy, I'm  
convinced of that. I just take the fresh stalks and bruise them so the  
stem (very soft and tender) juice can be rubbed on the rash. Almost a  
miracle how good this works.

If you want to look up the plant, the scientific name is Impatiens  
biflora and it grows in low-lying places just about everywhere poison  
ivy does. Probably other species of Impatiens would work too. I don't  
know, but I would try this on any other kind of rash too.

It gets the name jewelweed from the fact that a leaf placed under water  
shines like silver. It is quite amazing to see. Indians apparently  
used this plant to make fishing lures, and although I haven't tried it,  
I can't see why it wouldn't work.

Primitive cheers,

Andr 

My first choice would be broad-leaved plantain (Plantago major around here) leaves. I have also used curly dock (Rumex crispus) with some success. It has the bonus of having the same habitat as nettles so is readily found after you get stung.

This is supported by Varro Tyler, PhD in his book HERBS OF CHOICE:

"The results of a clinical study , in which a 1:4 jewelweed preparation was compared for its effectiveness with other standard poison ivy dermatitis treatments was published in 1958 (Annals of Allergy 1958;16:526-527). Of 115 patients treated with jewelweed, 108 responded 'most dramatically to the topical application of this medication and were entirely relieved of their symptoms within 2 or 3 days after the institution of treatment.' It was concluded that jewelweed is an excellent substitute for ACTH and the corticosteroids in the treatment of poison ivy dermatitis. The active principle in the plant responsible for this activity remains unidentified.

A few years ago I published a scientific article concerning the disinfecting properties of vinegar (acetic acid). It turns out that it is as effective at killing most organisms on contaminated equipment (and presumably skin) as commercial quaternary ammonium compounds. I will mail a reprint to anyone who e-mails their snail-mail address (only if you say that 3 times fast).

Karen Sherwood, former plant instructor of TB's school, recommends the  
crushed leaves of burdock. I have tried it and it seems to work but the  
effect is not dramatic.

X-Mozilla-Status: 0011

About 20 or so years ago, when I worked for the US Forest Service I used to take a substance in the spring that was made from the extract of PI leaves.

It was called Imune-Ivy, and was mixed with water and tasted like tea. It seemed to minimize my otherwise terrible reaction to PI. After a few years, the said it didn't really work and refused to buy it for us. I don't know if it is still around, but it did seem to help. Maybe this is what some of you are referring to.

On another "cure" that I have been subjected to. Back in my college days I was at a summer field camp in northern Wisconsin and got a terrible case from helping the camp director clear brush. I, too was swelled up like a balloon and had spent 3 days in bed not even able to eat. There were no doctors available in the area. It so happened that there was a week-long news conference/retreat for NASA going on at the camp and the head of space medicine from the Manned Spacecraft Center in Houston was there. The camp director had him come and take a look at me (didn't know they had to worry about PI on the moon). He told the doctor to go to the drug store in Ashland and get a gallon of some stuff. Don't remember what the name for it was, but it was a suspension of aluminum hydroxide - looked like gray dishwater. They wrapped me up like King Tut in strips of old sheets, shirts, whatever, and poured the stuff on me until it dripped out the other side. The next day they unwrapped me and I looked like a prune. But, the blisters were all gone. No itching, nothing! I scabbed over and in a week was good as new.

Does anybody know anything about this stuff? For really bad cases it seems to work miracles.

Grant Goltz

I think the solution you are talking about might have been aluminum acetate, also called Burow solution. It is used as a compress in a 1:20 to 1:40 dilution.

>From the book "The Encyclopedia of Medicinal Plants" by Andrew Chevallier, DK  
Publishing, Inc., 1996.

Chickweed (*Stellaria media*) cream is very effective. This is made by combining about 50 grams of the fresh herb with 150 grams of emulsifying wax (this is made by combining oil or fat with water into an emulsion, best done slowly in a blender or something similar - like making mayonaise), 70 grams of glycerine and about 80 ml of water. Heat it all up and simmer for about 3 hours, then strain through a jelly bag. put in small jars and store in the refrigerator.

For most effective relief, this treatment can be combined with an infusion of 5 grams (dried herb) of each of the following: Nettle (*Urtica dioica*), Heartsease (*Viola tricolor*), and Calendula (*Calendula officinalis*) in 750 ml of water taken regularly during the day. Or: A decoction of 5 grams of the root of each of the following: Dandelion (*Taraxocum officinale*), Yellow dock (*Rumex crispus*), and Burdock (*Arctium lappa*) in 750 ml of water. Drink 2 cups a day.

This all sounds kinda complex, but if you really have a problem with the nettle rash....

This book is an excellent source of information and I would highly reccommend it to any seriously interested in herbal remedies and the like. Although it is a bit pricey (\$40.00), it has more info than a handful of cheaper books combined.

BTW, for those interested in medicinal plants, check out the "Medicinal Plants of Native America Database" at:

<http://probe.nalusda.gov:8000/related/aboutmpnadb.html>

This and a bunch of other interesting plant info is at the National Agricultural Library of the USDA.

Once you get to this site hit the "query" link. At this point I would recommend doing the "Fuzzy Search" option. You will have to select the

MPNADB database (and/or some other ones) and hit "search" to get an input form.

This is an enormous database with everything cross-linked. It may seem too complicated at first glance, but play around a bit - there are tons of info there.

Marc,

Rattlesnake plantain, which also grows on the East coast, is actually a kind of an orchid. Common names can be confusing that way.

Marc, thanks so much for the scientific name for the plantain. Plantain here is a completely different plant!!! Now I'm confused because I have been following this thread with the idea that we were talking about *Plantago* spp.

Thanks for clearing this up, and don't forget everyone that we are an international group and that scientific names helps keep us all on the same wavelength. Burdock (*Arctium* spp.) has at least 30 different common names around the world, many of which are the same names as many other plants. Gets real confusing fast and leads to bad information being circulated.

Just the scientist in me rattling on again...

Subject: Tannic Acid (Netles/P.Ivy)

Content-Type: text/plain; charset="us-ascii"

Status: U

X-Mozilla-Status: 0001

Hi all,

Here is a snippet from my "Herbal Field Guide to Plant Familie" that might be helpful:

Tannic Acid

An "astringent" is an acid substance that causes tissues to constrict. If you taste an astringent substance you will experience the sensation of "cotton mouth" as the tissues constrict inside your mouth. The most common natural astringent is tannic acid. Gallic acid is also

astringent. The act of constricting tissues is medicinally useful in a number of ways.

First, it closes off secretions, especially of the digestive system, and is therefore useful for "drying up" diarrhea. Similarly, astringents tighten up ulcerated tissues, thus speeding the healing of stomach ulcers and bloody urine, as well as cuts, excema and eruptions on the skin, often used as a poultice or wash. Since they cause wounds to tighten-up and stop bleeding, they are sometimes listed as "hemeostatics" or "coagulants".

Astringents even tighten up inflamed tissues, thus being beneficial to swellings, sunburns, pimples, blisters, sore throats, inflamed or tired eyes, or as a sitz bath after childbirth to speed the healing of inflamed tissues. A few astringent plants have been used on headaches and to a limited extent on arthritic-type conditions, again to reduce inflamed tissues. Thus astringent herbs are sometimes listed as being "anti-inflammatory". (Hence the stinging nettle/poison ivy connection) Astringent herbs are sometimes used as a poultice to diminish varicose veins.

Since acids are generally harmful to bacteria, astringent plants are often also listed as being "antiseptic" or "antibiotic".

Through the act of tightening tissues, astringents act as a sort of "toner" or "strengthenener". For example, you can buy astringent facial toners at the store. Similarly, the leaves of astringent plants can be put in shoes to tighten tissues and protect against blistering. Internally, astringents can tone and strengthen mucous membranes, such as in the urinary tract. Most plants that have astringent properties are also "diuretic" in nature, meaning they make you urinate more. This effect appears to be due to drawing water out of the body cells. Bladder infections, and other urinary tract problems can be caused by excessive alkalinity, especially in women. The acid nature of the astringents can make them useful for counter-acting the alkalinity, while "toning" the urinary tract in the process.

Tannic acid is also used for tanning hides. That drying, puckering sensation that you get when you taste an astringent is the same action that works on the hides, drawing out the binders (proteins?), so the hide becomes more flexible. Over-consumption of these tannins is potentially dangerous, and countries where black tea is popular tend to have high rates of stomach cancer. Incidentally, milk in tea reduces the tannin effect. The tannin binds with the milk protein, instead of binding with the proteins of your stomach lining.

Tannins are among the most common plant constituents in nature. As one example, virtually every plant in the Rose family contains tannin. It is much easier to remember what tannic acid does, and know that the whole family (plus many plants in other families) contains tannin, than to try to remember each individual application listed for each plant.

People often speculate about how primitive cultures had to learn the uses of "every single plant" by "trial and error", but I think it was easier than that. You can identify the essential properties of the majority of plants (probably 90% or more) with just the basic senses and a very small amount of knowledge.

Always Peace,

I posted about I.V. steroids and I.M. epinephrine (adrenaline) for poison oak, but wasn't really considering eating any (not hardly!) and then trying to reverse self-inflicted damage. Just jokingly suggesting a course of treatment. I had a good natural non-reaction to poison oak (could wade through it) and walked through forest paths choked with it for years, on a daily basis (I am blonde, but think that irrelevant, BTW) and then one day WHAM! Fascinating watching oneself try to claw off their own skin (for months). Like an out of control drug addict, I imagine. I give P.O. a wide berth now, but naturally would like to desensitize. Just wondered. I lived in a mountain canyon (near naturalist Christopher Nyerges) stuffed with poison oak and knew a lady forest fighter there that reacted to poison-oak laden smoke from miles away. Could watch her swell up and wheeze when the smoke barely flew. Thanks to everyone for this helpful thread.

Chris

Good question! I know of great natural remedies for constipation, the best of which I think is Elderberry (scientifically proven), but what about natural remedies for the opposite ailment. Anyone?

I have heard that Cattail Root starch does the jobs without the  
constipation from over the counter medicine. Of course I could be wrong.

In one of his videos, and in an article in American Survival Guide, Chris Janowsky highly recommends a tea made from raspberry leaves for diarrhea. I have seen blackberry also in herbal books. The tannin content acts as an astringent. There are many other plants as well listed in any good herbal.

I have consulted some US Govt sources for the following:

For Diarrhea: 1st 24 hours, fluids only. If not relieved, (which if the person has Giardiasis or has contracted another intestinal parasite, they probably won't be) then try one of the following.(Continue with fluids only - small amounts many times a day)

- I. Fine Ground Charcoal, Fine Ground Dried Bones, or Fine Ground Chalk
    - A. Mix a "handful" with (treated) water and administerevery two hours until Diarrhea has stopped or slowed.
      1. If Possible, add an equal portion of apple pomace (basically whats left after pressing all the juice out of an apple) or ground up citrus rinds to the mixture. This makes it more effective.
    - II. Administer a strong tea solution every two hours (if you have tea of course).
    - III. If the above do not work; Boil hardwood inner tree bark for two hours to release as much of the tannic acid it contains as possible. Administer this vile tasting and smelling brew every two hours. This will stop most diarrhea episodes cold. (Be A Man! You can always hold your nose.)
- Other suggestions: Don't resume eating solid food until the symptoms ease. If you have rice, that would make a good starter food. Add salt if you have it to your water in small amounts to maintain some electrolyte balance. Watch out for signs of dehydration. Aspirin/Acetaminophen for fevers.

If you have access to drugs, the recommended therapy FOR GIARDIASIS is Quinacrine Hydrochloride 100 mg 3xD for 5-7 days. Or Flagyl (which is what my doc gave me - it worked quick) 250 mg 3xD for 10 fays.

Problem is, you don't know what you have unless you are diagnosed by having a stool culture done. You may have amoebic dysentery, or God knows what else. GENERAL DISCLAIMER - I AM NOT A DOCTOR!! Also, there is an article on the Wilderness Way site that talks about using talc for diarrhea. Good luck!

The tannin content acts as an >astringent. There are many other plants as well listed in any good herbal.

>

I just opened an herbal I have here and it mentioned things with astringent properties, and especially tannin. Agrimony (Agrimonia eupatoria), American Cranesbill (Germanium maculatum), and Tormentil (Potentilla erecta) are mentioned specifically

So... munch an oak. That's just one thing with tannin in it. Seems like walnut hulls too. Shouldn't hurt you unless you eat the whole tree

Blackberry leaf tea is one remedy, but it is a mild one.

Mark, are you sure tannin is "extremely" toxic? I have experimented with eating a few raw, unleached acorns from both white and red oak without any apparent effects. But then again, maybe half my liver is halv shot and I don't know it.

I will have to disagree with the statement that tannin is highly toxic. You get tannins when you drink tea. You get tannins when you eat many plants. I would not go overboard on consuming strong (undiluted) tannin solutions such as from boiling tree bark. But you can do that specifically for diarrhea - one good dose of it will usually cure diarrhea. (but it's gonna taste BAD!)

Rob,

The word extreme is, I suppose, relative. It is toxic, though. I  
to have eaten a few white oak acorns. They have the lowest  
tannic acid quantity of any of the oaks. I'm not sure I would  
eat many red or (especially) black oak acorns. They're so bitter  
anyway I'm not sure I would be able to get them down.

Mark

Hi all,

Here is a snippet from my "Herbal Field Guide to Plant Familie" that might be helpful:

#### Tannic Acid

An "astringent" is an acid substance that causes tissues to constrict. If you taste an astringent substance you will experience the sensation of "cotton mouth" as the tissues constrict inside your mouth. The most common natural astringent is tannic acid. Gallic acid is also astringent. The act of constricting tissues is medicinally useful in a number of ways.

First, it closes off secretions, especially of the digestive system, and is therefore useful for "drying up" diarrhea. Similarly, astringents tighten up ulcerated tissues, thus speeding the healing of stomach ulcers and bloody urine, as well as cuts, excema and eruptions on the skin, often used as a poultice or wash. Since they cause wounds to tighten-up and stop bleeding, they are sometimes listed as "hemeostatics" or "coagulants".

Astringents even tighten up inflamed tissues, thus being beneficial to swellings, sunburns, pimples, blisters, sore throats, inflamed or tired eyes, or as a sitz bath after childbirth to speed the healing of inflamed tissues. A few astringent plants have been used on headaches and to a limited extent on arthritic-type conditions, again to reduce inflamed tissues. Thus astringent herbs are sometimes listed as being "anti-inflammatory". (Hence the stinging nettle/poison ivy connection) Astringent herbs are sometimes used as a poultice to diminish varicose veins.

Since acids are generally harmful to bacteria, astringent plants are often also listed as being "antiseptic" or "antibiotic".

Through the act of tightening tissues, astringents act as a sort of "toner" or "strengthenner". For example, you can buy astringent facial toners at the store. Similarly, the leaves of astringent plants can be put in shoes to tighten tissues and protect against blistering. Internally, astringents can tone and strengthen mucous membranes, such as in the urinary tract. Most plants that have astringent properties are also "diuretic" in nature, meaning they make you urinate more. This effect appears to be due to drawing water out of the body cells. Bladder infections, and other urinary tract problems can be caused by excessive

alkalinity, especially in women. The acid nature of the astringents can make them useful for counter-acting the alkalinity, while "toning" the urinary tract in the process.

Tannic acid is also used for tanning hides. That drying, puckering sensation that you get when you taste an astringent is the same action that works on the hides, drawing out the binders (proteins?), so the hide becomes more flexible. Over-consumption of these tannins is potentially dangerous, and countries where black tea is popular tend to have high rates of stomach cancer. Incidentally, milk in tea reduces the tannin effect. The tannin binds with the milk protein, instead of binding with the proteins of your stomach lining.

Tannins are among the most common plant constituents in nature. As one example, virtually every plant in the Rose family contains tannin. It is much easier to remember what tannic acid does, and know that the whole family (plus many plants in other families) contains tannin, than to try to remember each individual application listed for each plant.

People often speculate about how primitive cultures had to learn the uses of "every single plant" by "trial and error", but I think it was easier than that. You can identify the essential properties of the majority of plants (probably 90% or more) with just the basic senses and a very small amount of knowledge.

Always Peace,

Hi Sean,

Again, many interesting threads you are suggesting, we're going to be busy this year!

I'll tackle the oil from animal fat question since I've done that a lot (hundreds of pounds).

Actually, this is a very simple process called "rendering". Place the raw animal fat in a kettle over very low heat (less than 250 degrees F) and wait.

The fat will slowly start melting and turn to a warm liquid. With a large batch this can take several hours. Eventually, all non-soluble materials will remain, floating in the oil. Strain the oil through a cloth and there you have it.

Naturally, once this oil cools down, it will harden somewhat, but just a little heat will make it liquid again.

Hope this helps as a starting point.

I, too, have experimented with animal fats, mainly for use in lighting. Andre's method is best for refined oil that will have many uses. If you need something down and dirty for lighting you can just boil the fat in water. Let the water cool and skim off the oil off the top now semi-solid. You can also fry it. Just fry and drain before it burns up. This oil can be used for many lighting applications. All you need is a wick and a container of some sort (shell, pottery, etc.). A wick is any material that will absorb the fuel oil and burn it quicker than it consumes itself. I like cattail fluff. Just saturate it, pinch it above the surface of the oil and light it. Dried, rolled mullein leaves also work well, just saturate and hang out of the fuel and light. Jute twine also works well, it works even better if you untwist it and cord some cattail fluff into it. This also works with cedar bark.

I render deer tallow to make soap and one sure fire way to keep the temp  
below 250 F is to put water in with it.

Keeps it around 212 F.

when it cools the water is on the bottom and most of the non-soluble  
stuff is on the bottom of the solidified fat (which is on the water of  
course)

and can be scraped off. I don't even strain it - it just comes out clean.

Is anyone familiar with how to make oils under survival situations? I've only found limited information on plant oil extraction and know very little (nothing) about how to prepare oils from animal fats.

I've read that for oil extraction from plant material (nuts, seeds, leaves, etc), the oil is best removed by an elaborate pressing operation, although boiling the materials and skimming the oil may be somewhat effective also. Anyone with any experience or ideas in this area?

I originally was looking for a good survival lubricant, but the lighting properties could also be quite handy (candles, torches, and the like).

I see this topic as having 3 major threads:

1. Oil from plants
2. Oil from animal fat
3. Other sources of lubricants (pine pitch?, beeswax?)

Sean;

While plant oils are not impossible to obtain, It would probably be easier to remove all visible fat from an animal and then render it, someone might check the FOXFIRE books for the exact wayto render fat, but I believe it involves the slow heating of the fat in a large pot and skimming off the impurities, until all that is left is clear oil. This was used for lamps, cooking (both for heat and for cooking/frying/baking), lubrication of weapons, etc. The process of rendering would have had to done carefully to

prevent grease fires. I think that's one of the reasons that large game animals were especially prized, That fat would be as valuable as much as the meat was. I haven't tried this myself, so anything I say about it should be considered suspect.

Hi Barent,

You don't need a very good seal because the tallow/oil is not liquid unless it is extremely warm out. Therefore, any of the above solutions will work, as will also cork, wood, spruce gum, cloth with string, and here's an oldtimer's solution that works real well: corncob centers.

Hi John,

With regards to these extremely advanced courses given by Tom Brown, where individuals are dropped for a month in a winter wilderness, I would love to have a few names and addresses of graduates who have actually survived those incredible ordeals. They would have mighty interesting stories to tell, and I would be willing to fly out to anywhere in the states to meet any of them and interview them for my research. Please try to obtain some names for me!

Thank you,

Andr 

Hello Bryce. I don't know if you've been reading the posts for the past week, but there has been much said about Tom Brown. He seems to be a very controversial man from what I have gleaned from this list (I'm new). I have read all of his books, and have signed up for the Standard course in April myself. I would suggest you get the archives and check out the dialog recently. There are some folks on this list who have made it clear that they are tired of the Tom Brown debate. Some have said that Tom is a fake, that Stalking Wolf never existed, that this has been documented by an investigative reporter (the report could not be referenced), etc. Some of his students on this list defended him adamantly, and convincingly. There was a most disturbing (to me) letter from one of his students describing a bad experience at the Tracked School with Tom. I think you can get the archives by asking Andre for them.

Well, I took a class from Tom, and he didn't attack anyone specifically,  
but he made it clear that /he/ was the world's foremost survival trainer,  
tracker, and philosopher, and everybody else was nitwits.

The only praise he ever gave other instructors was,

"He was one of my students."

Phil Goetz@cs.buffalo.edu

"You read those damn books out there, and they'll kill you.

I know. I've dragged out the bodies of people following that  
damn 'survival advice'. They've got plants listed as edible that  
will kill you."

I'd like to post this donation to the Primitive Skills Group from a New  
Zealand Forester, John Phair. Hope you'll be pleased.

It rained and it rained and it rained  
the average fall was well maintained  
and when the tracks were simple bogs  
it started raining cats and dogs  
after a drought of half an hour  
we had a most refreshing shower  
and then, most curious thing of all  
a gentle rain began to fall  
next day but one was fairly dry  
save for one deluge from the sky  
which wetted the party to the skin  
and then, at last - the rain set in.

Cheers John

.....

So, what's it going to take to get people to stop whining about Tom Brown? I have suggested privately e-mailing people on this subject, but that doesn't work. I for one have better things to do and would rather not have to wade through a bunch of mindless defense of Tom Brown. Or here's an idea for everyone who wants to continue this thread, start your own discussion list.

I have a better idea, let us not drop another hit of acid and become one  
with the flowers.

Flowers don't know the meaning of freedom of speech so they can't take it  
away from us :)

I am new to this list (signed on yesterday) and don't know jack from jill. That said, I subscribed to this list looking for survival skills. I have read here of some incredible skills! I am excited to learn about more. My confusion is thus: what does the above post have to do with survival? It reminds me of the old Python skit: the Argument Clinic. (No it doesn't. Yes, it DOES.)

Please understand, it is not my place to say what messages are addressed on this list, and that isn't my intention -- I just want to better understand the purpose of this list so I can know where I fit in, and what kind of submissions are acceptable and desired. The guidelines I was emailed when signing up said:  
> Remember! This group is intended for fun, sharing and learning about  
> primitive wilderness survival and living skills.

Oh, I think I got it: Primitive-Skills would naturally include bickering. (Always did in my family.) ;^)

With Love & Respect,  
Rees

Hi folks,

Since some of you seem to be bound and determined to misrepresent a reasonably good natured exchange between Kevin and myself, I think I ought to clear the decks.

The recent attack on my character by Bob Barr, and to a lesser extent by Ferrel, leaves me to wonder where the notion of good humored debate has gone. The notion certainly was not lost on Kevin with who I debated (and with whom I shared several very funny private exchanges). The debate has however taken on a life of it's own. Subsequent to the fun exchange and ribbing Kevin and I gave each other, I attempted to share some skills and experiential information that I thought might be of general interest to the group. From those postings I received no comment, question or notion of interest (though my words and concepts came through in other posts). The silence was pregnant.

I know that silence..... Some of you are afraid to speak out. Why? because you fear to upset the brownies who scream in defense of their guru. A man who I know (perhaps better than I've let on) and who does not want, nor need, their defense. Our exchanges were meant to draw out the strident

screams of indignant brownies, leaping to the defense of..... Not of Tom.... but of their own ex halted vision of the poor man. Stand on your own feet. Speak for yourself. Survival is not what "Tom says....." survival is independence, skills, personal strength, innovation (just what most of you demonstrate).

But for you brownies out there. I will give you a short sample of the private mail I received while Kevin and I played. (Oh! if you were the author of some of this, don't worry. No one will know but Karen and I. Of course if you want to fess up.... feel free!)

>I'd love to ask him questions to see how he can weasel his way out of >them... for example: (Hi Tom, could you send me a list of names for >those 48 people you mentioned made it through the 30 day winter survival >course with no clothing? I'd love to do a piece on their >stories.)

>  
>Keep em coming!

And

>I've been teaching survival for 20 years. I've never seen more ill educated >persons than the ones TB turns out in his assembly line school. None of these >people has any clue about the real skills of wilderness survival.....

And

>I can't for the life of me imagine how anyone can think that they will learn >anything about the wilderness when they sit in a group of a hundred > people while they listen to a grown man moan about how bad things are. >People just get ripped off... and the funny thing is... they love it!

And

>Are Tom Brown followers a bunch of whiners or what?!! I >hate they got stirred up, I'm tired of their crying. How can anyone take >seriously a 'teacher' that teaches "Spirit Tracking" and tells people >they can touch a track and tell what direction an animal was looking and >that they will no longer need physical tracking skills once they take >this course.

And

>I've taken several classes with Tom. At some point I realized that I had >learned that I really hadn't learned anything about survival but I thought >I could track a mouse fart. It became painfully obvious to me when I took a >survival program in Colorado and I had no idea what the teacher was talking >about.....

And

>Yeah, Tom's got a bit 'o the lightning rod about him, I guess. It's >probably those books. Hellacious publicity, plus "spiritual >mystery." I personally thought Tom was living under a self-imposed >"mystique of the tortured soul." Whatever. I don't judge him as >good or bad; I \*did\* judge that he was a man of good character; and >I \*don't\* envy his life. I mean, the poor guy lives in New Jersey!

Believe me, it goes on and on.

It goes on and on. It's not me folks, it's you. For those of you who are too fearful of the power Tom has in our little industry, I say "speak up". I always have said what was on my mind and I will continue to do so. My name sake, Diogenes, was the seeker of truth. I've had this nickname since I was a kid and I will continue to wear it.

Remember too. Seeking truth requires facing facts, getting evidence and learning. That is what this group is about. If you can't stand an examination of the most controversial figure in wilderness education..... Leave.

If you need to try to insult me, do it to my face. I'll defend myself.

If you value the skills I learned the hard way and tried to share with you all, let me know. If you don't, let me know and I will only share them with my students, ten at a time.

Sincerely

Ron Hood

BTW What is a brownie? Not just a student of Tom's, but a convert..... That's all.

XX

>"mystique of the tortured soul." Whatever. I don't judge him as  
>good or bad; I \*did\* judge that he was a man of good character; and  
>I \*don't\* envy his life. I mean, the poor guy lives in New Jersey!

It's always a pleasure to see one's private e-mail thrown into the public trough. Thank you, Mr. Truthseeker.

The above post to Ron was in the context of a longer message in which I'd asked him to provide the newspaper article he said he had that was so damning to Tom. Joe McCarthy once said he had a list of subversives, and no one bothered to ask to see it (because only a subversive would want to?). I'm not saying the article doesn't exist, but as someone who studied journalism in school and worked as a newspaperman, I felt like seeing this thing and judging it for myself.

I also included some bio information in my post to him to show that I've taken skills classes from several instructors and am not one of these semi-mythical "brownies." When I saw Ron's "let's be honest" post, I thought he was going to quote what these brownies were saying. \*That\* is what's missing here. Who are these so-called brownies he's so upset with?

Sure, it's easy to believe there are impressionable people (mostly under 30, I would guess) who look to Tom as a guru (an image which Tom did his best to dispel at the class I took from him). These people no doubt exist, and if they stick to it, life will grow them out of their need for discipleship -- when they have come to know what spiritual truth is on their own. So what's in it for a guy to makes fun of these truth seekers?! Tom is \*not\* just teaching physical survival skills, and that's why he makes a point of suggesting that if that's all you're interested in, then you should find another school. Now there are lots of people for whom the word "spirituality" conjures up a whole raft of ghosts and hobgoblins, and who must take cover behind a lot of pseudo-rationality and ignorant put-downs to keep feeling safe and in control of a world

that really isn't all that mysterious. So with these people in mind, there's always the implication that \*anyone\* who thinks Tom is a good guy is some kind of kook. In short, I think Ron's use of the term "brownie" is a cheap shot from a man who knows an epiphany when he has one. (Ron's foxhole turd epiphany reminded me of Carl Jung's -- where God dropped a grogan on a church -- and I agree with Ron and Carl that God has a great sense of humor!)

I'm sorry I said the things I did about Tom to Ron -- not because I disavow them, but because I intended them for Ron alone, assuming (through the little I know about him via his posts and his website) that he would hear it the way I meant it. I certainly couldn't make that assumption for the entire group!

Finally, Ron de-contextualized my joke about New Jersey by taking off the :- ) dude I had tacked to the end. That was a \*joke\*, mang!

If anyone has a beef with what I said, please e-mail me directly at:

jwall@woodruff-sawyer.com

Muchas thank yous,

Aloha,

--John

Greetings.

As Don Henley says - "They stabbed it with thier steely knives but they just can't kill the beast" - this is turning into a B-movie - the Thread That Wouldn't Die! This is also guaranteed to be my absolute last post on this subject.

As I see it there are a couple of different schools of thought in the Primitive Skills arena. There are the west coast practitioners like Larry Dean Olsen, David Wescott, and Ron Hood. There are scientists like Ev Calahan and Dr Bourbeau. There are east coast practitioners like Tom Brown and Benjamin Pressley and Charles Worsham. They all have things to teach us. Unfortunately there is a rift between the Brownsters like myself and many others. I have tried to come to an understanding of why this has occured, and I have several ideas that aren't really important here. (I will discuss it with anyone who likes via private E-mail) For me the point is not that the rift exists. THE POINT IS I WANT TO LEARN FROM ALL OF YOU! Lets get beyond who learned from who and who said what. Lets focus on the skills. Can we agree to leave the personalities out of the discussions and focus on the skills. Otherwise we will succeed in driving folks away like myself and Ron Hood.

Ron and I, who originally began this thread, have come to a very respectful understanding. I want to hear what he has to offer, and by the way, he has unbelievably great credentials AND EXPERIENCE. It is a shame if anyone feels thay are not listened to or valued. As Rodney King said, can't we all just get along?

Thanks for hearing one final plea.

Kevin

Ron/Bob/Kevin

I've been lurking around ever since this primitive server started and very much enjoy the humour and knowledge you provide and would hate to see you no longer participate.

The debates about TB have been interesting, but I worry now that they are going too far and are becoming very personal to those involved. This is making it uncomfortable for those of us on the periphery, kind of like watching your parents or friends arguing and wanting to help but also not wanting to get involved.

It now seems as though battle lines are being drawn and we are being asked to take sides, I quote "I know that silence..... Some of you are afraid to speak out. Why? because you fear to upset the brownies who scream in defense of their guru."

I have no fear of speaking out about most things. Perhaps the pregnant silence was embarrassment?

I too have some concerns about Tom Brown, mainly because his pseudo-spiritual mumbo jumbo gets in the way of the meat of his teaching. I feel that he has a tendency to exaggerate and am mildly worried by the religious cult developing around him. Frankly though I don't lose sleep over it, it's just not important enough for me to care about. For those that are concerned about this issue, there is a TB listserver which may well be the appropriate forum for this kind of discussion.

(BTW I don't necessarily blame TB for the cult thing. There's a saying that

when people stop believing in anything, they start believing in everything. In this, TB fills a role model for those looking for a saviour.)

Please keep up the primitive skills postings and I hope that we can get some of the steam out of the TB thread before someone gets too upset.

Cheers

Ron, and the rest of you,

As one who has been silent on this exchange, I'll speak up to some extent. Myself, I saw no need to participate in casting aspersions on others. Also, being deaf, I've learned to sit and listen to exchanges, to see what I can learn from them. From the entire TB debate that was on the list, I

simply gathered that there was a debate about certain aspects of the TB culture that were so diffuse that clarification was desired. Further, I did pick up that this exchange was respectful between the two of you. That suited me fine. Between you and Kevin, I gathered that you both agree on the need to teach, but also on the need to actually learn what was taught, and to build on that so that one can stand on his own feet rather than quoting someone who was an unwilling prophet, in the eyes of a few rabid students of his. There are always those who will seek out someone to follow, but not actually practice what he simply tries to teach. And to justify their attendance after finding out how much work and practice it takes to actually become merely good at what is taught, they deify the teacher to justify their own unwillingness to put in the time and effort of actual practice, preferring rather to nitpick fine details and justify that as understanding. This is true not only with people like TB (to use the subject matter) but also with many other teachers. For example, look inside just about any religion. I do not mean to disparage anyone, be it Ron, Kevin, TB, or anyone else. This is merely an observation of mine.

Myself, I have no knowledge of TB other than what I've picked up in groups like this one. I've not even read his books. From what I gather, I gather that his background is undefined, but that the skills he teaches are worthwhile, but could also be learned cheaper with other instructors if you want to search them out. Similar to shopping at Sears or at Wal-mart: one might cost more because of the name, but you can get the same thing at either. In either case, the use of what you learn is critical, as is learning it well enough to pass it on to the next generation, or anyone else who expresses an interest.

Finally, it appears from your posting that I do not get all the posts. Or if I do, they're so multi-threaded that I didn't realize they were part of the same thread. I do hope you, and Kevin too, will continue to populate this list as you both have a lot to teach. In general, I don't have the experience of either of you, and so I keep quiet and listen and learn. But when I do know about something, such as using slings, I will speak up and offer my input for what it's worth.

That last paragraph of yours above is rather poignant. When this started, and when that note about the use of turds being blasphemous popped up, I was seriously afraid that this list would erupt into a flame war, similar to what I've seen in various newsgroups. And if it did, I knew that we would lose a lot of the talent and skills that frequent this list. Don't let that happen.

BTW, I had a discussion with a few friends, of assorted religious background, and the general consensus was "Turd? What's the big deal?" Also, we figured that if anyone was blaspheming, it was that writer, hiding behind the Lord's name (the e-mail address). Also, the general consensus was also that this person is an example of the type of person I was discussing up above in my first paragraph: someone quoting the tracts and verses without understanding them. Such exist, and we must learn to live around them.

Friends, Listmembers, Terrans, let us cast this foul taste aside and return to learning, sharing stories, and living together in this list.

I now return you to your regularly scheduled list...

Bill B.

Well said John, Well said.

But...this has brought up an interesting question for me. Do you experienced teachers say that the spiritual aspect is not or cannot be incorporated into tracking? and/or primitive skills? hummm....I find this thought interesting. I follow many (spiritual) gut instincts in my life, with everything I do. Some people can and do have the ability to "see" "feel" what "was/is" there. This has been proven in quantam physics; and parapsychology. I would be interested to know how the

"teachers" (as in....learn a living teaching primitive skills) think of this. If this is not considered something for the list then please email me privately. BTW...this is a serious question here.

But I will say this.....I do tend to get annoyed when someone says "if you can't take us talking about a teacher.....leave". I have already said....we are learn from each other...students from teachers...and teachers from students...all of us from each other. I do not like to be invited to leave if I have personally different views. (not that I thought this was directed personally at me) but the point of the matter is we ALL have a right to be here. No one (in my humble opinion) should be told to leave....

Gentlemen....we are all part of each other...all of us....connected to one another as human beings on this planet. We ALL are unique with our own viewpoints and have the right to have them; as we ALL grow with age and experience. Let us not cast others aside or out just because they do not happen to share our position on some things.

Sherri

I realize that this is a subject of dying popularity especially within the parameters of this group and I apologize for my unwillingness to walk away from such a controversial, no-win topic. However, the issue pertaining to the integrity of Tom Brown Jr. should be of paramount interest to anyone involved with the primitive arts. Recognize one fact, for those of you unfamiliar with the source; The multi-million dollar Tracker organization is, by far, the single most influential outreach program in the field. Not a point worthy of criticism by any means. However, we all should concern ourselves with what is being served on that \$700 plate.

I am an advanced Tracker student. I admit that for one reason only; I hope it is clear. I have seen the smoke and the mirrors. I have witnessed the quality of instruction drop as average class size exceeds 100. I have witnessed The Tracker succumb to the enormous demands of a large class as he fumbles to remember where he had originally, so decisively, said that track was. I have seen him mistake my thumb print for a fox print. I can sympathize with the frustration of Mr. Goetz.

I am suggesting that we have a responsibility. I am dissatisfied that this topic has been relinquished to the back burners of private correspondence. We ARE part of the whole.

Ron, I would appreciate information on that article you mentioned earlier and would like to be included in future discussions.

I'll be in touch with you by E-mail. I recognize the truth of what you said in your message. It is interesting that some folks want to ban the debate..... Free speech... dead on the net? Naw... never happen, not in a group whose core being is founded on independence.

I want you to know that I believe this to be a very important topic, just as you so wisely pointed out. I don't really care about TB. He will fall under his own weight. It sounds like that is what is happening now. More importantly, I think, everyone NOW knows the issue will be met squarely. I plan to ignore further posts directed at me unless I find them to particularly offensive or spectacularly incorrect (as in Sherri's post. Her comments I will deal with privately).

Meanwhile.... with your help and Kevin's and other free thinking students of the primitive arts we can all assist new members with the notion that not everyone thinks that TB is the font of knowledge. "Tom says..... " is a trigger, we can tell them to keep their finger off it.

Thank you for a thoughtful post.

X-Mozilla-Status: 0011

Welcome & thank you Mr. Peterson, your words are very wise. I hope they will be accepted by all in this group. It is the skills that are important & the fact is - like it or not - as you point out, these 2 individuals have been responsible for introducing many to a closer kinship with the wilderness. Isn't that the ultimate goal we too would like to accomplish? As someone already wisely said in an earlier post, let's concentrate on the skills, & give credit if it is due. I was glad to see the thread end.

As one who has been fairly recently introduced to primitive skills, I've just been sucking up the info posted. Even the steamers caught me with my mouth open (I'll have a devilish smile every time someone eats a steamed hot dog - they're called steamies in MTL). Keep the skills (& comedy) rolling folks as you have lots to teach & some of us have lots to learn. I would also like to thank Dr. Bourbeau for this wonderfully informative group. My intro will come soon.

> (snip) Mr. Peterson wrote:

>I found the recent exchange concerning two very prominent primitive practitioners very amusing and sad at the same time. Both have contributed greatly to the advancement of primitive skills. That's probably all that should be said. I know Mr. Brown only by his good reputation and that he has helped open the eyes of many to primitive skills and methods. This is wonderful! My eyes were opened by Larry Dean Olsen in 1969. We have been good friends ever since and I appreciate that he has been a mentor to me. This is also wonderful.

>

>What has been the result? Thousands of people have been blessed with a new awareness. That's what's important. Let's drive on folks and share our knowledge.

Subject: My 2 cents worth

Content-Type: text

Status: U

X-Mozilla-Status: 0001

With the discussion of TB and others out there, I just had to put in my 2 cents worth. Here goes.

Tom has been ONE of the greatest teachers in my life. He is NOT the ONLY teacher in my life. Likewise, I am a teacher to others. Do I, as anyone else have problems, shortcomings etc. Sure! That does not mean I cannot learn from others or teach the skills that I have learned (regardless of who taught them to me). I have learned many skills from many teachers and am grateful to them all. I hold Tom (with his faults and flaws) in high regard, though he has not achieved deity status. I have also learned valuable things from John & Jerry McP, Olsen, Hood, etc through a variety of media.

I have NEVER heard Tom talk badly about any person or any > school!

>

Both Bobb and Phil are correct. The point being Tom has not criticized an individual, but some methodology which is his right to do, and your right not to accept if you have found another way that works for you. A case in point, all you need to do is reference the Colorado Division of Wildlife guid called "the art of survival", look to the section on shelter (pg2) to see how it can easily get someone killed.

"You read those damn books out there, and they'll kill you. I know. I've dragged out the bodies of people following that damn 'survival advice'. They've got plants listed as edible that will kill you."

It is Never the WHO but the WHAT that is important. Simply teach, learn, and leave the "who has the biggest butt" for the beauty pagents. Sorry this has turned into \$2.00 worth.

Bobb, Great job at the Philosophy 1 workshop.

For the Children, For the Earth,

That's an admirable goal. It brings to mind a question of mine:  
>Survival trainers, including Tom Brown, sometimes boast that  
>they can train people to survive anywhere, anytime. They give  
>the impression that one can wander through the wilds freely,  
>without the burden of possessions, making what you need when you  
>need it.

>I have visited many American Indian museums in New York State,  
>Arizona, and New Mexico, and one thing that impressed me  
>repeatedly is that these Indians (Iroquois, Navajo, Hopi,  
>Anasazi, Sinagua) were not wide-ranging foragers free of  
>possessions.

>Nor were they able to survive "anytime, anywhere".

>Phil Goetz@cs.buffalo.edu

What I've heard Tom say is that someone with special expertise and/or training (e.g. an Apache scout or a diligent Tracker student) could survive anywhere, anytime, as long as they only

had themselves to support. He explicitly stated in one or more classes I've attended that the average traditional person, dependent on existence in a social group for survival, most likely did not have this level of skills. It certainly wouldn't be true of a family, band, or village with dependent children and oldsters to support.

Even in the case of an Apache scout, this doesn't rule out death by mishap or misjudgment. I think it was in \_Grandfather\_ that Tom describes a situation in which Stalking Wolf gets caught in the far north in the winter and comes close to dying.

Even in traditional hunting-gathering societies, I doubt that the model of the "happy wanderer" applies. I suspect that most traditional peoples are interested in the same things most modern people are: to live comfortably and raise a family, not to wander freely. I doubt that they would want to move unless availability of food or firewood, or pressure from hostile neighbors, required it. I also doubt they would needlessly destroy belongings to start over fresh at a new location unless the belongings were easy to make and/or difficult to transport.

In sum, I don't think the claim made by modern instructors that they can teach you to survive "anywhere, anytime" starting from scratch (if true) has anything to do with the way the majority of traditional and prehistoric peoples ever lived or aspired to live.

>I think Andre's post says it best of all. I would run far from anyone  
>who teaches you skills for a week and then tells you you can survive. I  
>have met too many students (of mainly Tom Brown) that did not even know  
>how to make a friction fire.....

I also must state for the record that Tom never makes the claim that you can survive lavishly after just one class. Like Bob said earlier, many of his students hear what they want to hear. Tom does say that you could "survive" with just a week's training, but I take that to mean that one would not die in an emergency. Basically, if you can make a shelter, find water, with great luck build a fire, you will probably last in the woods until you are found. He makes it very clear in the classes I have attended, helped, and taught, that you had better not just walk into a life threatening situation without lots of practice. In fact he recommends that as you go backpacking, you take along less and less equipment each time until you GRADUALLY wean yourself of your need for equipment.

In fact there is a very funny story told by Jon Young (WAS & Kamana), who was a member of Tom's Scout troop many years ago. (Imagine having Tom as a Scoutmaster!) Tom told the boys to bring whatever they wanted on the first camping trip. Of course they brought mountains of ridiculous stuff. But on each trip, their precious stuff would disappear. Then, Tom would accidentally back his jeep over the tents. Then he would accidentally drop the sleeping bags into the stream. You get the picture. By the end of six months his boy scouts were able to camp lean and mean - and as Jon tells it, there was no use taking anything with you anyway, because it would always mysteriously disappear.

I challenge anyone critical of Tom to learn first hand. Take a class and then judge. I think you will see much of the criticism of Mr Brown is based on rumour, innuendo, and simple untruth. Some of it may legitimately be based on students who, as Bob mentioned, hear what they want to hear, and do stupid things. I doubt you will find that much in

many of Tom's more advanced students. They are in my experience a very humble bunch who want to learn from every available source. I for example have learned from Benjamin Pressley. His postings have been great, and his article in the last Journal of Primitive Technology on torches was fabulous. We all can learn from each other and I hope we can all keep an open mind and respect one another's perspectives.

Sorry folks but I can't let that one go unanswered. It sounds like ol' BP has an axe to grind with ol' Tom Brown. Gotta say that anyone who knows TB and his commitment to the earth -- and the things which go way beyond practicing primitive skills -- would have more respect. It simply isn't true that Tom teaches you skills for a week and then tells you you can survive. Rather, he makes it VERY clear that you need dirt-time. The basics taught in the standard class are what he considers the most essential for the most-likely survival situation, plus a wetting of the

appetite for the more important aspects of Stalking Wolf's teaching--the spiritual, the caretaker attitude, and love. Tom covers bowdrill and handdrill in the Standard class, and 95% of the class gets the fire going, usually with less-than-dry cedar. Anybody who's been through that class well knows their limitations, and usually is humble enough not to boast about survival skills. If BP ran into some that weren't like this it is likely an anomaly, and I doubt widespread among Tracker students.

Perhaps the problem is that TB's reputation and apparent success causes some others to feel the need to take shots at him rather than sharing the consciousness around the need for these skills to stay alive. My own experience with TB after eight courses, are beyond words. I have never been to any school including five years of engineering school where I learned as much about as many important things as what TB has to offer. My observation of his commitment to finding better ways of teaching more and more folks -- spreading himself razor thin while maintaining the essence of the teachings -- is that his efforts are unmatched. The fights over local environmental issues in the Pine barrens, and his proximity to New York City, are evidence of his working the front lines. It's much easier to live and teach in the beautiful wilderness areas. I could go on but this is off subject. I hope we need not continue to clutter up this list with shots at TB or any other teachers.....Unless the good Dr. AFB doesn't mind :)

>Oh, and by the way, I wasn't just picking on Tom Brown, just sharing  
>my experiences with some of his students I'm familiar with. I can  
>recommend some other teachers I am more confident in, though, that cost  
>a whole lot less.

I'd sure like to know them. My budget is tight just like everybody else's.  
Regards.

Barent,

Did I miss something? I wasn't under the impression that anyone was  
upset. Maybe I just don't have my psychic antennas out....I thought  
each was just sharing opinions on their viewpoints.

I agree that we should use the tech. available to us. The point, in my  
opinion, is that if you are thrown into a survival situation without any  
(or just a little) tech. Do you have the ability to handle this and  
survive. I am trying to learn the skills to do so...also want to pass  
this on to my child and his children...we are losing so much valuable  
skills with our tech. I want my family to carry the skills and ability.  
I like my nice warm house and hot shower as much as anyone...but this is  
not to say it will always be here...all it would take is a major  
castatrophe (sp)...sadly, most of society would be totally lost without  
the grocery store, car, etc. Panic would set in...we are too soft and  
too far removed from nature and our roots. Our peace of mind is being  
lost, taken over by stress...and "I see" I want, therefore "I must have"  
type of consumerism. We have forgotten the beauty of the flowers, the  
earth, and animals...we are so busy rushing, rushing, rushing. We have  
forgotten our connections with this planet...we are destroying  
everything with our greed and lack of concern.

hummm....I took off on a tangent here....sorry....but this is just my  
opinion...I do not blame or feel anger at others who do not hold this  
mindset...It is my feelings.

In peace

Sherri

I have also been following the thread and I have to say that I don't like the direction it is taking. No flame wars please.

If survival means to continue existence, to propagate, to continue a gene line, then it is most prudent to use whatever techniques, technology, resources, assistance is available. The two divergent paths of thought here include what I, IMHO, have categorized as pragmatists and idealists (for want of a better term). The pragmatists accept the premise that continuation of the gene line (my children) is the overriding concern and are concerned primarily with that. Idealists, although they quite clearly accept the premise (they are living) want to consider only the possibilities on the idealists plane. That is, if it is possible don't say that it isn't.

My ancestors, like yours, survived over millenia using various skills. Now, I have that task and I have advantages available to me that were unavailable to them. In a "true" survival situation, where one has no choice in the matter and must do or die, I will make use of every advantage that technological advancement has given me that I still have

to use and will go to great lengths to learn. It is also true that mankind live the most luxuriant of lifestyles for all time. My home, for example, is comfortable year round, unlike even the most wealthy or priveleged of people of only 200 years ago (Ron's point on technology).

You are both right, just looking at the same question from different angles. That is the idea of the group, to get that different angle. I don't think that there is any reason to get irritated when someone disagrees, but find out why, you might just learn something.

It sure was a long way around the golden rule, which by the way was a part of another survival tool, but I would like to see this wonderfully informative group continue and thrive.

Peace to all.

--

Sincerely,

Barent

Hi Phil,

Great question, Phil, I'll try to be brief even though I want to scream bloody murder for the same reasons you bring up. So much nonsense out there...

My specialty has been "get dropped there naked and try to survive" research for the last

25 years. I've tried this hundreds of times in simulated conditions, and there is no way in hell anyone is going to make ME believe that it's easy. NO WAY! It is always,

always a very painful and difficult experience to be dropped off in the bush with no gear and try to survive, at least here in Quebec. If it's winter, you freeze your buns

off, and if it's summer, you get bitten alive. If it's fall or spring, you are soaking

wet from the constant rains and miserable.

Now it is true that with good training you can make life, if not comfortable, at least, less miserable.

Most of all, this depends on LUCK! If you happen to fall upon a fresh wolf kill, a weakened and dying Caribou, a great berry patch, a fish spawning stream, a particular spot with tons of dead wood, good weather, etc., survival becomes fairly easy and can approach the pleasurable. However, if the opposite happens, wet soggy snow, no berries

and no animals, no gear to fall back upon etc., you are lucky just to stay alive without

sustaining injury. Lots of pain, but no permanent injuries- that's the best you can hope for, and with proper survival training, is always possible in my estimation, to survive at least in the short term until rescue.

Most of the time, you have a mixture of the two. Some good elements, some rotten, it varies from day to day and from spot to spot.

People who boast of how easy everything is done tend to forget that after a single day

of badluck (rotten weather for instance), your capacity to function and think right is

drastically reduced through lack of sleep and food. On some of my experimental trips, I

noticed my pulse go down to 32 beats a minute, and watched myself take 20 minutes to go

gather a single piece of firewood. Hey, surviving ain't easy in those conditions!

All of my research on aboriginal ways of life confirms my field testing on this. Even long ago, when an indian was far removed from his primitive gear, he would sometimes be OK, sometimes deal with pain and discomfort but be OK, sometimes starve to death. It depended on luck and the richness of the environment.

That's my quick opinion on this, hope it helps answer your question...

Andr 

That's an admirable goal. It brings to mind a question of mine:  
Survival trainers, including Tom Brown, sometimes boast that they can  
train people to survive anywhere, anytime. They give the impression  
that one can wander through the wilds freely, without the burden of  
possessions, making what you need when you need it.

I have visited many American Indian museums in New York State, Arizona, and  
New Mexico, and one thing that impressed me repeatedly is that these Indians  
(Iroquois, Navajo, Hopi, Anasazi, Sinagua) were not wide-ranging foragers  
free of possessions. They were tied to their homes and things more than we  
are today. They had large, heavy implements for drying, storing, processing,  
and cooking food, which were very labor-intensive to make. They were tied  
to the cycle of the seasons -- not only did they have to lay in food for the  
winter, but many of the raw materials they needed could only be collected  
in certain seasons, so they needed to gather and stockpile them.  
The Iroquois moved their villages, but only about once every ten years,  
and only ten to thirty miles at a time. The Hopi and their ancestors  
never moved at all.

Nor were they able to survive "anytime, anywhere". Starvation was not  
uncommon. In the fall of 1778 (or 1779?), US Generals Clinton and Sullivan  
marched through NY State to subdue the Iroquois \*, burning stores of crops  
as they went. Perhaps 1/3 of the affected Indians starved to death that  
winter, despite having greater training and greater natural resources than  
today's survival experts.

The wild areas left to us today in the northeast US -- the Appalachians, the  
Catskills, the Adirondacks -- are areas where Indians did not live  
because they were too inhospitable. I suspect they were not numerous in  
the Pine Barrens either, though I don't know. (There is a large Iroquois  
reservation in the Alleghenies, the site of the original Cornplanter  
reservation, but I don't think Indians lived there before the Revolutionary  
War. I recall that Cornplanter was relocated to there.)

All this leads me to suspect that the claim that people can survive  
"anytime, anywhere", even if dropped into the wilderness in the middle of  
winter, and the related idea that people can live without the burden  
of possessions, are myths, with great emotional appeal but little truth.

What do the people on these lists with more experience think?

Phil Goetz@cs.buffalo.edu

\* This campaign was the idea of George Washington himself. He thought that  
the Iroquois had sided with the British in the Revolutionary War, though what  
had actually happened was that they were divided in council and a minority  
joined the British side. You can see roadside signs across NY State  
commemorating this march in glowing terms for paving the way for civilization

in New York, signs which I think were put up around the 1960s (a time when large tracts of Indian land were still being taken, as for the Kinzua Dam in Alleghany). Now that so much time has elapsed that we no longer have to DO anything if we admit that Americans treated the Indians poorly, we are much more willing to recognize the Clinton-Sullivan campaign as simple genocide.

Perhaps taken out of context? I'm not familiar with the Tom Browns or any others. I know what I've learned thru experience and reading and applying. Perhaps what they really mean is: "I can train you to be able to survive until found anytime, anywhere." I also have a problem with the latter part of that quote above, in that it's possible to live without the burden of possessions. Is not clothing a possession? Your hunting implements? Your trapping implements? And the time you put into your bow and arrows and spear...do you want to do that every time you need them? Can you guarantee the materials will be there when you decide to make another one? And what about food? That's also a possession, same questions apply.

No, one can't live without possessions. No way, no how, unless it's for a few days in the summer. Any other time, you need possessions of some type just to stay alive. But one can survive anytime, anywhere, for a while if properly trained.

My \$0.02.

Well, if you have a good knife, you can make traps for food & clothes; a bow; build a survival hut etc. The plastic will make sure you have water. It is possible to do this and make it as long as one thinks clearly and knows the right skills and does not panic.

See?

Sherri

Didn't realize this was also posted to the list or would have posted my reply as well. Confounded headers. :-)

My reply to Sherri was basically that no, I don't see it. Right away you've

got two prized possessions: the knife and the plastic for the sun still.

My guess here is that while I'm agreeing with Sherri on this, I'm disagreeing with the definition and usage of the word "possessions."

Let me restate it in a more interesting way.

Can you live indefinitely with just possessions that you can carry with you, so that you can go off in any direction and not need to come back if you are delayed or lose your direction? As in a long scouting mission, but without a horse.

Phil

>Well, if you have a good knife, you can make traps for food & clothes; a  
>bow; build a survival hut etc. The plastic will make sure you have  
>water. It is possible to do this and make it as long as one thinks  
>clearly and knows the right skills and does not panic.

Sheri;

The trick is not having the knife or the plastic. Being dropped out here  
naked without any possessions at all. Will you have the knowledge to find  
shelter, the right materials to make fire with, clothing, drink, the right  
stone to make simple flake tools?

I, myself can make simple flake tools, but have trouble with firestarting  
from scratch. Even here in the desert, I can find enough material for a  
debris hut or insulated scout pit, but will I be able to build it before  
hypothermia or thirst does me in. Looking for water is an art in itself out  
here.

Learning more each day.

I agree, it seems that you always do the best you can with what you've  
got. When you are used to having a lot it is hard to adjust,  
particularly large numbers of people in one place at one time. I think  
that the true goal is to live long enough to get better equipment and  
food. Carlin was right, we have stuff and we have a house for a place to  
keep our stuff. Everyone has a house (if they are surviving properly) of  
some kind or another.

Hi Sherri,

If you could give me the name and address of any of those 48 students who have "made it" through this course, I would love to interview them for my research. Can you try to link me up with any of them through your contacts? Thank you.

In a message dated 97-01-02 15:22:36 EST, you write:

<<

I have visited many American Indian museums in New York State, Arizona, and New Mexico, and one thing that impressed me repeatedly is that these Indians (Iroquois, Navajo, Hopi, Anasazi, Sinagua) were not wide-ranging foragers free of possessions. They were tied to their homes and things more than we are today. >>

Speaking with an archeologist in the SW New Mexico area, I was told that

this was true in good times of plenty. But in times of environmental stress, The villages would scatter and small bands would return to the "old old ways" and survive as migrating foragers until such times as the rains returned bringing back times of plenty. Then the small roving bands would regather and resume or renew their village life and with more leisure time, develop cultural traits (art, etc.....)

Peace,  
JW

>I hope there's some training first...

My message was forwarded to this list by someone else from the Tracker list, so you got it without any background. Just to fill you in, you have to complete several courses plus one other advanced, invitation-only course, before you would be invited on the Montana course. Although Tom (Brown) didn't say how you'd get your clothes so fast, I assume (probably incorrectly) that you'd pretty

much have to find and kill a hibernating bear, use its flesh and hide, and even take over its cave....

At the Standard, Tom also mentioned an invitation-only class where he drops you off in the Bob Marshall Wilderness (Montana) in the middle of winter with just the clothes on your back (and not much clothing at that), and maybe a knife?, and returns four days later to take your clothing. If you get that far (having made your own new clothing by then), you spend an additional 26 days out there; otherwise he takes you out (having commuted via snow machine). Tom said only something like 48 students had ever completed this course.

I don't think anyone on this list has ever done it, although I haven't asked in several months.

Also, if you're interested in being a "happy wanderer," think of

yourself as being one right now, no matter what you're doing to survive.

I hope there's some training first... I know how to build a snow shelter of a rudimentary sort, but for this even I need some tool like a shovel or a broken ski, something more than a knife. Even at that, I'd probably be dead in a hour under the conditions you describe. The only actual survival course and practice I've ever had (nothing but a knife and my clothing allowed) was in the tropics, and it was summer to boot...

Fishing was great!

I think Andre's post says it best of all. I would run far from anyone who teaches you skills for a week and then tells you you can survive. I have met too many students (of mainly Tom Brown) that did not even know how to make a friction fire. I also know some of his students who were told this by Tom Brown and attempted to do so and had to be rescued. One has to carefully hone one's skills over time becoming proficient over time. Then one should test their skills a little at a time. For example, take your modern gear to camp out and resolve yourself not to make fire with matches, only by friction methods. But, take your matches as a back-up, just don't use them unless you have too. Find out where your weaknesses are then work on your skills that you are weak on. As you become more proficient then try doing with lesss and less. We modern primitives have the privilege of doing this, working backwards, so to speak. We should take advantage of it. Don't place yourself and others at risk.

Oh, and by the way, I wasn't just picking on Tom Brown, just sharing my experiences with some of his students I'm familiar with. I can recommend some other teachers I am more confident in, though, that cost a whole lot less.

Ben,

I couldn't agree with you more and I know exactly what your talking about with Tom's teachings. On the other hand alot of problems happen because students just hear what they want to hear. Your post that you just wrote is almost word for word what Tom says in his standard class. I have taken many classes from Tom and have helped out at 3 different standards and he said the same thing at everyone.

I say this not to stand up for Tom but to let people know that when we hear something new, our brain fills in 80% from our file cabinet and 20% is what we really see. Thats why at a crime scene everyone has a different story as to what happened.

Your point is well taken and I hope it prompts us all to practice more and to leave our HUGE EGOS behind, so were not too proud to take matches (or other things) along for safety while were learning and teaching.

Walk in Balance,  
Bob Barr

I have been watching with much interest this thread of opinions I unintentionally started. I agree with much ...you must be able to have the mental, emotional stability that allows you to sit down and take a realistic look at where you are and what needs to happen, without panic. And I also agree that most individuals faced with a tragedy, would not pull themselves together enough to face their situation. I think it takes a particular type of person to do this. A person who has faced many tragedy's and issues in their lives and came out the other side of them better instead of bitter. A person of this mentality usually is used to facing situations realistically. I agree that it takes many many years of hard practice to be able to be self-sufficient in the wild with only a few "possessions" (smile)...ie...knife and plastic.

I personally have not taken any of Tom Brown's classes yet, but I like his thoughts and writings and I have learned much from his books. I intend to take some classes from him altho I will have to save my pennies to do so. I need to meet him in person so I can feel his energy. I also, am interested in the names of the other guides of wilderness living that you mentioned Ted; if you would be so kind as to post these.

But I still stand on my original statement. It can be done.

smiles and blessings,  
Sherri

I will answer your question with my own opinion and some historical background that I am aware of. First of all, I think it not prudent to try to live equipment free. It wouldn't be much of a life IMHO. It would seem that living this way would require such great hardship and sacrifice of comfort and even health, that it would only be prudent in an emergency. Here is where the historical part comes in. The Apache were a wandering people. They lived in a very harsh environment. The accounts of them at war indicate an ability to go for extended periods without external support, and only what they carried on a belt or in their hands. Bear in mind, these were the warriors going on punitive

raids. They had the ability to travel through the desert, finding water, covering sometimes 60 to 80 miles a day. They were incredible warriors by anyone's standards. Here are some caveats however. They usually had a definite prize in mind when they went raiding: Horses. They stole the horses, rode them till they dropped, and then ate them. They also made extensive use of caches of supplies and ammunition. They traveled in small groups, hence needing smaller provisions, and they left their families home. Given these qualifications, were they still great survivalists? In my opinion, the greatest. They survived one of the harshest environments known. They used their skills to get them through, but they always had food waiting for them if their raid was successful, and they almost always had caches around for use in an emergency. Historical record indicates they used those caches frequently. So even the best trained, toughest soldiers in history were not able to sustain themselves entirely without supplies and preparation. Now, I am not talking about the Apache Scouts, the equivalent of our Navy Seals, but that is another story altogether...

Just my opinion.

Kevin

Thanks, but my question wasn't whether you could do it after a week's training. My question was whether it is feasible even for someone with years of training. Clearly it is POSSIBLE, since I think people have done it, but is it prudent? Would such a person have a high likelihood of dying even if well-trained? Is it feasible for a family with children?

Phil

Hey folks!

I was working under the impression (delusion?) that most folks here had some EXPERIENCE at survival living. I can't believe that folks doubt that survival living is possible! It amazes me..... Try this one on for size.

Wake up Phil and Kevin!

>>Thanks, but my question wasn't whether you could do it after a week's training.  
>>My question was whether it is feasible even for someone with years of training.  
>>Clearly it is POSSIBLE, since I think people have done it, but is it prudent?  
>>Would such a person have a high likelihood of dying even if well-trained?  
>>Is it feasible for a family with children?  
>>  
>>Phil

We've been tool makers on this planet for at least a hundred thousand years. That's over this entire planet. During those years we created and lived on this earth using survival living skills.

Take a piece of line ten feet long call it 100,000 years. Divide that in half and call it 50,000 years, divide again and call it 25,000 years. At that point European "Indians" were drawing pictures in caves in France. The American Indian was still trying to grunt his way across a land bridge. Divide again for 12,500 years. The American Indian was discovering flint and the European Indians were creating edifices, records on rock and having ceremonial burials. Humans were STILL using survival skills, comfortably. Divide your line again and again at 6,250 and 3,125 years. The line is now pretty short. The Egyptians were working on advanced mathematics, creating pyramids, calendars..... whole cultures were rising and falling all over Asia and Europe. The American Indian was still trying to crawl out of the mud. But they were surviving. Divide your line again and again and again at 1562 years and 781 years and 390 years. The line is now quite short. The American Indian was now in ascendancy on this continent. The Europeans, Asians, Africans, Ottomans, Romans, Greeks, Phoenicians, Hittites, Syrians, Aztecs, Mayans.... etc. had all built civilizations, been close to the earth, learned and forgotten millennia of survival skills BUT, most of this planet still depended on what you call survival skills. It wasn't until the last division on your line, at around 200 years (can you even hold the survival line by this little button of time on the string) that this synthetic civilization arose and we began to forget our survival skills.

The folks in this little group (I think!???) are trying to rediscover some of these lost skills.

>I will answer your question with my own opinion and some historical  
>background that I am aware of. First of all, I think it not prudent to  
>try to live equipment free. It wouldn't be much of a life IMHO. It  
>would seem that living this way would require such great hardship and

>an emergency.

>Just my opinion.

> Kevin

Prudent!? You are here because of a few thousand generations of imprudent survivalists... Much of a life? Your statement is based on your notions of comfort and convenience..... not on fact. I know hundreds of folks who live off the land, Well and comfortably. Where? all over the world. In South America I lived with natives who walk happily into the jungle with nothing, naked, and live as comfortably as they do at home in their hut. I know folks here in the states who do the same. I'm sure Benjamin P. and many others in this group can do it. Perhaps it's YOUR turn to rediscover your roots.

Now for the big one... TB

If I take issue with TB it is with his American Indian centric opinions.... not his skills. I knew Tom 20 years ago, long before he developed his rabid following of "brownies". The Tom I knew would shudder at the vision of what he became. If you are insulted by this comment... so be it. Consider your position well, history is full of zealots. There are many philosophies and followers for those philosophies..... brownies are only a very small group. To be sure, Tom's course's teach good skills, period. I've read his books (as I've read the books from hundreds of other authors) and what I find is a tired rehash of stories and incidents taken from other sources. Shades of Don Juan. What we hear are American indian legends, taken out of context and blasted into some sort of surreal narrative. Fine, if you want fiction.

If Tom's stories butter your bread, good for you. Read, enjoy and live your life by TB's teachings. If you are an individual, read and learn from many sources and then choose your OWN PATH. You have many lives to lead don't waste them all on another persons "path".

A couple of years ago a Chinese friend of mine told me a story.

A Buddhist was sitting in the shade under a large tree, meditating about life. In his meditation he asked the spirits how many lives he would lead. A spirit came down to him and pointed at the large Sycamore above his head and said "You will have as many lives as there are leaves on that tree" The Buddhist looked at the tree, saw the uncountable leaves, looked at the spirit and said "So Few!"

Get a few lives.....

Peace,

Ron Hood

I was wondering when someone would get around to mentioning  
this...smiles

As for Tom, we all have our spiritual lessons to learn and I do not feel  
Tom is any different than the rest of us. It is so easy for people to  
sling judgements of this or that one. I personally take the position of  
many teachers, many lessons, and walk my path. But then I have always  
done this. I have learned much from Tom Browns books, the Kamana, this  
thread, the tracker thread,,,,,etc.....

With love and blessings,  
Sherri

What the original thread asked, what I was responding to, and what you seemed to have missed was whether or not it was adviseable to attempt to live in full survival without any equipment and with a family. I have gone into the woods with only a knife for survival living, and after two days I found I didn't need the knife. Yes it is possible. In fact, I found it a delightful experience. Attempting to do that with my wife and five children ranging in age from 10 to 1 yr old would be quite a challenge. I still believe I could do it, but not nearly as easily as I would on my own. Of course, many people are capable of walking into the woods naked. The thread was also asking whether attempting to survive with what you carry in your hands is adviseable. In my experience, I accumulate more than just a handfull of possessions along the way. By the third day I have traps, bowls, hopefully some hides in process, etc. I suppose I could simply forage under the right circumstances for a prolonged period of time, but that is what I was refering to as being uncomfortable over a long

period of time.

As for your opinion of Tom Brown, I care little. I have studied with many teachers of wilderness survival, read many books, practised, experimented, and lived on my own. While I am not nearly as well traveled or experienced as you, I feel like I can do all right for myself. Tom happens to be one teacher that I like. I prefer to see people who criticize Tom have some first hand experience upon which to base their observations. You seem to have had contact with Tom sometime, therefore I respect your opinion as valid in your eyes. There are many paths. His is not one you care for, fine by me. I am not trying to convert anyone to Brownie-ism. I just don't like people without first hand experience with Tom taking shots at him. I was impressed with your credentials when you introduced yourself, and I thought you would probably have a lot of good things to teach. I hope I can continue to learn from your postings. Peace and have a great day.

You didn't read my question very carefully, especially considering the way you reacted. Of course people can live without supermarkets. The question is whether they can live without having a home base, a stock of food, or without preparing for the upcoming seasons. Hence the thread title, "Happy WANDERER". The question is also about how factors like having children, living in a northern climate, or living in the marginal and/or overutilized wild lands left to us today affects the answer.

I would love to hear more particulars of how they live and the land that they live in.

Would anyone care to venture a guess on how many acres of southern woodland would be required to support a family of four living as hunter-gathers. Some of yall have some knowledge of other culture living close to h/g style, and might could venture a guess.

I'm going to guess about 1 square mile at a minimum, but I dont have any numbers or data to back it up.

So, to live in a "primative" life style, sans agriculture, how many acres does it take ?

I think that you are underestimating the area. I think that in order to support a family without overhunting the area you are looking at a minimum of 1 square mile per person(just a guess and it might be conservative) This would not have to be owned, but must be accessable.

Ron Wrote:

>>Actually, Larry Dean Olsen taught this long before Ol' Tom put it into  
>> his book. I believe Tom took a few lessons from Larry back in the  
>>early '70's. That explains why so much of his material is nearly  
>>identical to Larry's. I think Larry maybe "Stalking Wolf".<<

Now the facts:

Actually I have heard this before, though not from Larry's lips, only from those who will profit from denegrating Tom Brown (like those who run other schools). Larry Dean Olsen was at Brigham Young University in the early seventies, running the wilderness program through the University that was the Genesis of BOSS. Tom did not attend BYU and take Larry's program, which was the only way to get the program back then. (I was there at BYU way back when) While Tom and Larry may have met, (anyone care to say when or where they met?) who is to say who was the teacher and who was the student? I have tremendous respect for Larry and all he has done for this field, but the fact is he did not teach Tom what Tom knows. Larry was not teaching public classes at that time. BOSS wasn't started until 1980 by Doug Nelson and David Wescott, also out of BYU. By the way, the Tracker School started in 1977.

As for Stalking Wolf, in order to prove he was the figment of Tom's imagination, you would have to go back and talk to people who knew Tom as a boy and ask them if they knew Stalking Wolf. I have personally talked to three individuals who knew Tom AND Stalking Wolf, and who describe him exactly as Tom does. Are they all lying? I don't think so.

So Ron, while you love to discredit Tom as often as you can, lets face some facts, and keep this list focused on Primitive Skills and not personalities. If defending Tom this way makes me a zealot, then I guess I am one. However, I am not trying to convert anyone, just tell the facts as I know them. Besides, it is a real waste of time to have to respond this way. I mean it when I say that you have a lot to teach and I want to hear more of what you have to say about survival skills. Besides, your Steamers stories are comedy classics. How about a book call Steamers Stories?

Finally, my copy of Outdoor Survival Skills by Olsen does not mention

chickweed at all, so where exactly does Larry teach this little tidbit?

Just the facts mam,  
Kevin

Thanks for your response Ron. I have not heard of Larry Dean Olsen. Is the "material" you mentioned in book form? Are you suggesting that Tom Brown is using Stalking Wolf as a metaphor, and that he was not an actual person? If Larry Olsen has books in print, I would love to get the names. Thanks again.

Ron,

Did you ever think about how your dislike for Tom Brown makes you look to other people? How does continually putting someone down help others to grow and learn? I have had and helped out at many classes at Tom's school and I have NEVER heard Tom talk badly about any person or any school! It's no wonder the world is in the shape it's in when the few people that teach primitive skills can't put their ego's and insecurities aside and just teach. What kind of teacher would you choose if you were the student reading all the comments?

Bob,

>Did you ever think about how your dislike for Tom Brown makes you look  
>to other people?

Wake up..... We've had this discussion. It was fun while it lasted. It went away. (Kevin... You out there?) You must have your head up your..... in the sand. You cannot take a portion of an argument, that was part of an extended exchange, and make it your platform to criticize another. It makes you look rather ignorant. It is a gross mis-statement to suggest that I "dislike" Tom. Wrong, Tom is good at what he does.

What you did when you took that part of our long exchange was to misrepresent the entire context in which that discussion was taking place. If you gained from your association with him..... good for you. Now be mature enough to understand that discussing issues does not connote "dislike". The exchange that was going on at that time dealt with a number of issues, not the least of which was what you exemplified in your attack on me.

Ego has nothing to do with it. My students don't say "Ron says....." I teach them to stand on their skills and say "I say....." With belief in their skills they have the confidence to speak on their own authority. They also know that I do not speak ill of Tom or any other instructor..... though we will discuss the issue if it comes up.

Please..... If you need to send insults, do it to my Email and don't burden the rest of the group with character assassinations.

Hi Kevin,

Thanks for laying out the arguments for the rest of us to see. Now we don't have to wait for them to emerge from the fog, piecemeal. I would be happy to put this controversy to rest (at least in this little group of students!). I've had direct contact with perhaps 30 or 40 of TB's students and I have a difficult time responding to their questions about TB. From time to time folks email me with comments about TB's "Theft" of Olsens material and with other details about which I know nothing. I do know that Tom's credibility is in question. If I can find it, someplace in this mass of paper's I call an office, is a long scathing article by an investigative reporter who did look into Tom's history. His conclusion..... Tom is a snake oil salesman who lies about his qualifications. I will attempt to find this little jewel so you can go to work on it.

> Larry Dean Olsen was at Brigham Young University in  
>the early seventies, running the wilderness program through the  
>University that was the Genesis of BOSS. Tom did not attend BYU and take  
>Larry's program, which was the only way to get the program back then.

> Larry was not teaching public classes at that time.

Not true. Larry taught classes to the public through Continuing Education at BYU starting in 1966. His Youth Leadership course was put into the curriculum in 1967 (the same year he earned his BA). He continued teaching in Continuing Education (Publicly) for another three years. Larry also conducted seminars and laboratories as a visiting professor at a number of colleges and universities in 1970-73, I attended several of them. Larry's program was frequently copied and implemented in colleges. I helped implement his curriculum at Los Angeles Valley College in 1971.

While we would need to speak with Larry about this, it certainly makes the argument that TB took Larry's course, feasible. I don't know if they met at that time or not. I do know that the ranks of survival instructors were very thin back then. Nearly all of us knew of one another, visited one another to

learn and share (like this group only in person) and help to push the wisdom's of the primitive arts. We also worked to endorse one-anothers unique approach to wilderness education.

>the way, the Tracker School started in 1977.

Five years after I began teaching professionally and ten years after Larry published his First edition of "Outdoor Survival Skills"

>As for Stalking Wolf, in order to prove he was the figment of Tom's  
>imagination, you would have to go back and talk to people who knew Tom  
>as a boy and ask them if they knew Stalking Wolf. I have personally  
>talked to three individuals who knew Tom AND Stalking Wolf, and who  
>describe him exactly as Tom does. Are they all lying? I don't think  
>so.

Actually that is EXACTLY what this reporter (I promise..... I will try to find the article... If anybody else has a copy, please post it) said that he did. It was his contention that there was no "Stalking Wolf", that Tom grew up in the city, and had no contact with the wilderness until he became an adult. Who knows who is lying, did you know stalking wolf? There are many manipulative techniques that will lead people to believe that they met or witnessed something. How do I know? I also make and sell magic. In fact, in addition to the "woodsmaster" videos we sell, we also produce Magic instruction videos. I know how people can be led to believe..... it is my work. I should hasten to add that WE do not use these techniques at Hoods Woods. I do not want disciples. We maintain VERY small classes (6-10 folks) who have an interest in a personal wilderness experience and a desire to use the skills we teach. Sharing my knowledge is an avocation and a life style, not my primary income. Check out the videos, you'll see what I mean.

>So Ron, while you love to discredit Tom as often as you can, lets face  
>some facts, and keep this list focused on Primitive Skills and not  
>personalities.

Tom is a running target. His people intercede for him at every turn. Only Tom knows the truth. Even his books are penned by other authors (as told to). Did he ever visit your tracker group? Does he ever speak privately with any of you? How many are in his classes... I hear 60 to 150 folks at a time..... is that true? Lessee..... My rough estimate is that TB must be pulling in about 3 mil a year..... Old Stalking Wolf must be turning over in his grave. Inquiring minds want to know. Teach me, tell me the truth..... I discredit Tom! No, I think not, Tom does a fine job of that all by his lonesome.

I hope you can see that I have nothing to gain by attacking Tom. I only gain by learning what drives brownies to behave so defensively whenever TB's name is mentioned.

About "Staking Wolf" the New York Apache(?!!!)..... I deeply believe in spirit guides and learnings from the great unconscious. We know little about the spirit world but attempts to learn are important to our growth. As important as that attempt is, the requirement that we separate "Magic" from true metaphysical evidence is even more compelling.

> If defending Tom this way makes me a zealot, then I guess  
>I am one. However, I am not trying to convert anyone, just tell the

>facts as I know them.

And as you learn more facts my wilderness brother (and I do view you that way) be open enough to question what you had thought of as facts. I do, I have and I will continue to question facts that I "Know". I've learned, and changed my opinion many times. That is part of being a survivor. When the facts about TB are in the open..... I sincerely hope that they represent him favorably. Meanwhile do what you must. Someone needs to represent his interests. By doing so you do not become a zealot, only another reasoning member of the argument.

> Besides, it is a real waste of time to have to respond this way.

I don't think so. These are important issues. Since the entire Tracker group seems to have jumped over here (WELCOME!) it's important that the character and interests of this group remain independent of the "Tom says....." statements I don't give a shit about what "Tom says...." let him say it. Too many of the brownies I've met have used "Tom says....". Lets dig into the other sources that offer real information, accurate data and believable experiences.

Knowledge is a little like a copy of a recording. Each copy is a little weaker and a little less accurate unless you enhance the recording with new data. Repeating TB's stuff is just another recording of a recording that he made.

> I mean it when I say that you have a lot to teach and  
>I want to hear more of what you have to say about survival skills.  
>Besides, your Steamers stories are comedy classics. How about a book  
>call Steamers Stories?

Thank you! I hope that some of you who posted to the various "Turds" discussions would be willing to allow me to post that thread with your attribution on my site. I'm creating a subsection to the site library that will be filled with various rantings and ravings of mine and others.

>Finally, my copy of Outdoor Survival Skills by Olsen does not mention  
>chickweed at all, so where exactly does Larry teach this little tidbit?

Larry circulated various "edible and useful" handouts in his workshops. I made notes on many of these items in my LDO notebooks. That is where I found it.

"Mild Medicinal Plants..... Cattail, Chickweed, Plantain, Pounded and mixed with rendered animal fat for a salve for burns and chapped lips." 1971

Thanks for the response Kevin..... I enjoy your additions and comments.

Finally, from the Sanskrit

It cannot be stolen by thieves,  
nor can it be taken away by kings.  
It cannot be divided among brothers and  
it does not cause a load on your shoulders.  
If spent, it indeed always keeps growing.  
The wealth of knowledge is the most superior wealth of all.

Peace

Om! May the Lord protect us, may he cause us to enjoy,  
may we exert together,  
may our studies be thorough and faithful,  
may we never quarrel with each other.  
Om Peace, Peace, Peace.

Ron:

Rather than include more of the rhetoric that you and I are both pretty good at I suggest that you and I agree to disagree about Tom Brown. I have a live and let live attitude. I hope you will consider the same. Tom doesn't attack you, so why not leave him alone? I, for Benjamin's sake am not going to comment publicly again on Tom. (By the way Benjamin, are my comments mindless?)

My experience with Tom is firsthand and very personal. Based on my observation at very close range over a long period of time, and my own investigation of his character, I have concluded that what Tom claims is true. Do I expect you to take that at face value? No. Everyone must make their own decisions based on the best available facts.

I understand your frustration when you hear his students say "Tom says..." I too find that frustrating. I would much rather hear "In my experience..." I too find that Tom has been elevated to some kind of Prophet status by SOME of his students and that also bothers me. He urged me to not believe anything he told me until I had tried it for myself. That is incredibly great advice to everyone reading this post.

I do not speak for Tom. But I hate to see the same old stories perpetuated without fact or first hand experience. If he had any interest, he would speak for himself. Frankly, he doesn't have the time or the inclination. When I have asked him why he doesn't spend more time dealing with his critics he responds that it wouldn't matter anyway. I am inclined to agree. I doubt there is anything I or he could say that would change your mind.

Lets keep the list focused on skills not personalities. Lets leave Tom Brown out of discussions here. Visit the Tracker list if you want to talk about Tom, or contact me directly. I always enjoy the debate - whether it gets us anywhere or not.

Kevin

Please don't focus on one word, i.e. "mindless". I agree I could have used a better choice of words. I did not mean anyone on this list is mindless, for sure, I have met some people I am *very* impressed with their skill level on here. I wish to contribute and to learn from you all. THAT is what this group is about. I forget where I read it at or even exactly how it was worded, but I read that the best teacher is one who imparts their knowledge regardless of whether their name is remembered or not. That is why I have more of a desire to learn and teach skills than to focus on a single person. I myself am very proud of my mentors along the way. I am very careful to give honor where honor is due and credit where credit is due in everything I write or share. Sherri, for one, has asked me where I learned and I thank her for that opportunity to share with her who some of those people were, in addition to my own experimentation and research along the way. I guess I just want to get back to focusing on skills in this group. Forgive any emotional over reaction, if applicable.

I suppose there is some value in debating whether an instructor is worth our financial investment or not. I'm just not sure this medium is the place to debate that or not. When searching for a good instructor it depends on what you are looking for instruction in. One needs to

determine whether they are in search of philosophical or spiritual guidance or is one looking to learn physical skills that can be learned and taught to others that would help in a survival situation. There definitely is a value to inquiring from the instructor's students on what they really learned and can do. It won't take long to figure out what their particular teacher majors in. As I said, I'm just not sure this is the place to discuss it. If everyone disagrees with me then I will either tolerate or gracefully bow out. Perhaps it would be a good idea to review the purposes of this group that Andre established for us before we say.

At TRIBE, for example, we established a policy from the start not to promote any religious, spiritual, psychological or political viewpoints. It isn't that we are against these things, it is just that we 1) feel we can best honor everyone's beliefs by not promoting any particular belief system, and, 2) we have seen too many good primitive skills events ruined because they allowed views to be publicly presented that offended others who had just as valid beliefs and as a result lost some very good supporters that had much to offer in skills. It has kept us out of a lot of trouble and we have never received anything but praise for this policy. In fact, I know of a couple of major events that have changed their policies because they have seen the success of such a policy as this. There are plenty of so-called 'spiritual' happenings around and not enough good quality primitive skills events, in my opinion. TRIBE, by the way, is not a commercial venture. It is an organization that operates non-profit for the purpose of education and providing a network and medium whereby knowledge and resources may be shared with one another.

I don't want to see anyone leave this group because we have got away from what we all have something to contribute to that will benefit us all and that is primitive, wilderness and survival skill knowledge. I don't care who your favorite teacher is, anyone is welcome to this group, as far as I'm concerned if he wishes to contribute, or sit back and learn about, primitive, wilderness and survival skills.

Primitive skills is one thing we all have in common. No matter what part of the world our ancestry lies in, if you go back far enough in their history, there was a time they lived off of only what nature provided. That is a thread that runs deep through us all. But, again, if the majority rules otherwise I will either tolerate it or bow out gracefully. Sorry for the lengthy use of bandwidth, I just don't want to be misunderstood.

To all:

I have listened to the Tom Brown debate for the last eight and a half years, since I first encountered it in 1988 at the revival of Rabbitstick Rendezvous in Rexburg, Idaho. I have to confess a gravitation to gossip, and I could share new light on the subject for you (I can play both sides of the issue). Nevertheless, I will avoid the temptation to do so, because that is not the purpose for being part of this group (I will not e-mail anybody one-on-one either).

I would like to ask Andre to add a rule banning the Tom Brown debate from this group. The currently subscribed members might achieve a truce, but tomorrow there will be new members subscribing who will restart the debate... let's break the vicious cycle now.

Also, the steamer discussion was fresh for awhile, now it is just old and stinks...

ALWAYS Peace (anything else is war),

I appreciate the sentiment, but impractical. Andre can ask us to stop it for now, but it will be raised again, by newcomers as you suggest, whether there is a rule or not. Perhaps Andre should create a text file that he sends to the list when this issue raises its head. It could be polite and say something like "We are aware of the potential controversies surrounding this man. We suggest you not talk about it, since it causes many hurt feelings, and the argument generates only heat, and never light!"

I just want to request a stop to any further comments from anyone who took me wrong when I used Tom Brown's name. I truly was not bad mouthing the man, as I said. I do not teach primitive and survival skills as my only living. I hold a full time job and teach, write and freely share knowledge as a sideline because I truly enjoy sharing it. I am not in competition with anyone, so I have no need to put down anyone for that reason. I would not do it if I was in competition. One of the rerasons I started TRIBE was to let people know about people who were not so well known that were highly skilled and did not cost so much. For in my opinion, knowledge not taught is knowledge lost. I have found most people have appreciated that, for like me there are a lot of people out there who can't afford some of these high dollar teachers (Don't read Tom Brown exclusively into this. There are many high priced teachers around.).

I am here to pass on knowledge. Answer questions where I can. Point you to others who can answer your questions, if I can't or if they can do a better job at it. If anyone wishes to further comment on the subject, please e-mail me privately. Do not post it to the group. Let's stay focused on the skills and sharing of usable knowledge. If anyone ever wants a list of teachers I know of that are reasonably priced and highly qualified, e-mail me privately and I will e-mail you a list.

If I have offended anyone personally. My apologies. I will be more careful in the future. Re-examine what I said in a positive light and you will see I did not slander the man. I'd rather drop it, but as I said, if you have any further discussion e-mail me privately. Thanks for bandwidth. PEACE.

To one and all,  
We are gathered here on this list to learn about skills practiced by our ancestors. Up till now I've enjoyed some great posts from nearly everyone, I feel that I am a rank beginner in primitive technology and only starting to achieve some minor craftsmanship in fiber work and other primitive skills. So I would learn from all of you. Most of my knowledge of primitive tech comes from books and articles penned by some of the people that we have on this list. Some of it comes from other sources, including the spoken word from people that have actually had to rely on their skills to survive. I am willing to share what little I know to go with what many of you know. Some of you people are awesome. The practical knowledge that is available here is unbelievable. I am concerned about one thing though. As an R.N. I watch a bunch of cardiac rythm tracings, every once in a while electrical interference occurs we call that artifact. Some times that artifact is so bad that it completly covers over the tracing that I am trying to look at. Then one has to go in and replace the old patches with new ones or move some impeding object that is causing problems so that the tracing can once again be seen. On this list, the main message is primitive skills and renewing primitive knowledge, this rift between our members is just artifact that is obscuring the main message. I don't want any of you to move on, and I would not like to leave either, so what I propose is what corporate types are calling a culture change, Please lets go on trading knowledge and leave any personal flames in private e-mail.(actually I would like those to end too, but hey I'm often unrealistic) ;-)

Thanks to all my teachers here (and there). This is seriously great. As far as I'm concerned, you folks that have been out there doing it for a long, long time deserve special recognition and consideration. You all have my respect, whatever your take on subjects like politics, philosophy, spiritualism, asthesisism, indelicate crudities, poison arrows or poaching...whatever. Say whatever you want. I don't want to see the most experienced get up and leave because of to much of a need for a relaxed forum ("On rope - SLACK). I value everything you are saying - only so much gets through anyway . All I want is to stay alive and you people are my best bet. This is not a hobby or an exercise. That other stuff is an illusion. There is no 2nd chance for the unlucky and the unprepared. You're for real. That's the deal. Keep on.

-- Chris

Perhaps that's true if he's *never* done it before, but I took some photos of a fellow beginner in my class at Tom Brown's school last May as he took the opportunity of a wild thunderstorm (tornado warning sirens were howling in the background) to see if he could catch his tinder bundle on fire in the rain. He was the only one (out of 65 or so students) who even tried. He succeeded. I think he succeeded, in large part, because of his attitude. I'll see if I can still reach him via e-mail and get him to comment.

I'm sorry I didn't get the name of the original poster John was responding to but I need to throw my two cents in here because I think this is a key issue. My experience is that confidence is important, however, overconfidence will kill you! When we arrogantly assume that fire, food, shelter etc. are simply the result of our impecable and insurmountable skills and personal strength we are in for a rude and possibly abrupt awakening. Not only is attitude important, it and our spiritual relationship with the materials and the land we use, might be the single most important skill we have. Without an attitude of humility to powers greater than ourselves and an attitude of thanksgiving and respect for our skills and the gifts we are being given, all these skills we are talking about are nothing more than another excuse to kill animals, dig holes, cut down trees and generally rip up the land and, frankly at this point in time, who needs it! Yes, any serious practitioner needs to learn and put in "dirt time". Not doing that and

living on faith alone is as ridiculous as ignoring this basic principal. However, I have learned this the hard way and use stories of my own folly on this score in classes I teach, and it is a lesson I seem to need to learn over and over again, however, every time I start getting arrogant and think it's me and my all powerful skills that are giving me fire etc., I get a lesson in humility. To me this is basic, practical, get results kind of spirituality- certainly the kind that guided our ancient ancestors. At this point in human history we would do well to contemplate this as we look around at the mess we have created by believing that humans were the center of the universe. I see this same attitude alive and well in the "primitive tech." community as it is elsewhere in our society and it is equally repulsive to me.

Enough for my sermon :-)

Mark

Hi everyone,

To answer this question, and try to answer Phil's question a bit better than I did last time about survival possibilities, here's this:

The main problem in surviving in the woods for a long time is food. Read any of the old explorer tales- Fraser, Franklin, Hearne etc. and you get this distinctive feeling, almost a mathematical formula:

food available=happy & carefree

no food=unhappy & worried

I'm not saying there are no other problems, but if you've got food, you have energy and you can work at solving those problems of cold, bugs etc.

The problem is it takes a LOT of food to survive. Inuit people traditionnally had to kill 200 caribou a year, plus other animals to fend for their immediate family.

Quick mathematics will show you the scope of the problem. You need at least 2500 KCal a day to maintain your weight in the long term. Fresh meat or fish is worth about 500 KCal/lb if it's lean, and fat around 3000 KCal/lb. Many forest animals have little fat. Let's average this out, for discussion sake to 1000KCal/lb, which is the best you can hope for. This means 2.5 lbs of meat a day (butchered), which is one of the best foods available. Over one year, therefore, you need  $365 \times 2.5\text{lbs} = 912.5$  or almost 1000 lbs of butchered meat per person. That's a lot of muskrats, partridges and rabbits. It's also a couple of moose and a dozen caribou.

Now back to the question: can this be done? Like Ron says, of course it can be done! But, ONLY IF THERE ARE ANIMALS where you happen to be! Today, massive hunting, fishing, trapping, clear-cut logging and pollution have depleted animals from many areas. On a one month trip I once took, I saw 4 partridges and not a single rabbit track or dropping.

Another problem one might face is that when starting out with absolutely no gear, especially in cold climates, the first day is spent on tool and fire building (and figuring out how to get water from snow) leaving time for only minor shelter, the second day is spent on better shelter and bedding, and the third day is usually where food gathering begins. Some weakness starts setting in unless food is available, and this weakness cycle gets worse as each day progresses, especially when expanding energy gathering tons of firewood to offset the cold and wet due to

inadequate clothing. Judgment can also diminish here, and unprepared persons can start acting foolishly and spend their last energy wandering and end up dead from hypothermia before having a chance to set up traps and otherwise obtain food. On the other hand, if food is somehow obtainable in the first few days, survival becomes easier and easier because of the accumulation of tools, weapons, and other primitively manufacture gear (clothing, baskets, rafts etc).

Note however, that obtaining 1000 lbs of food is not an easy matter! If you can catch 5000 eels when they migrate past the point your are on, then you will be fine. But if there are not even insects available to eat, too bad. We only survive if nature wills...

Survival thus depends, in my opinion, on 4 major factors:

1- Luck! As I posted previously, luck determines to a large extent what you find to help you survive. No choice on this one.

2- Richness of environment. Although all environments have their particular sources of survival, some are extremely demanding and could kill even the most skillfully trained persons. No choice on this one.

3- Possessions. Naked at 40 below diminishes chances of survival greatly. A knife can make a lot of difference... as can a match. Prevention enters here- choose prevention.

4- Skills training. Practice enters here- just about the only skills which will be useful out there are the ones that are ingrained because you have done them before. This is what this list is all about- providing info for practicing.

Attitude and desire to live is sometimes quoted as a factor for survival, but has much less to do with surviving than generally estimated, in my opinion, because attitude is very greatly proportional to confidence which is very greatly proportional to skills training. To demonstrate this, send a beginner out in rain to rub sticks when he has never done it before and watch him give up! Meditation and positive attitude won't help!

The sum of these 4 above mentioned factors will decide on your fate and determine what I call the "level of survival difficulty" of the situation your are in. The problem is always one of time. Is there enough time available depending on luck, richness of environment, possessions available (that permit you to save time), and prior training (which speeds up problem solving), to let you survive? If the answer is yes, the myth of the happy wanderer is possible. If the answer is no, it is not.

So, to me, the answer to the myth of the happy wanderer question is MAYBE!

AndrÈ

One of my professors was fond of pointing out that the first law of thermodynamics was actually discovered by a biologist, a British doctor who served upon sailing ships, and happend to notice that men ate less in warmer climates. He concluded that one needs less energy to maintain body tempreture when the ambient tempreture helps out by being relatively high.

> Survival thus depends, in my opinion, on 4 major factors:

>

Absolutely. These same 4 apply in different ways to both survival proper, and primitive living situations which are not quite the same thing. Sometimes we are blurring the distinction between primitive living and survival. The latter becomes the former as more time is involved. I do not expect to parachute into the wilderness armed only with a knife and the clothing on my back any time soon. But I might find myself cut off on an isolated road in my car, or on a trail closed by snow. In these situations, being creative in the use of what may be a virtual wealth of hi-tech equipment I carry on my back, will make the same kind of difference when it comes to waiting out a 3 or 4 day rescue.

I believe Andre hit the nail on this one..... Just a quick note on the landscape out here in California. The Handbook of North American Indians (vol8, Robert Heizer) puts the number of aboriginals as low as 3 per square mile in the rougher lands of the Sierra Nevada mountain range to as high as 14 per mile in in some of the flat lands. Kroeber suggested that as many as 70 could subsist in the Napa, Sonoma area during the Acorn season. Acorns have a fairly high fat and protein content and stored quite well. Meat was not a big part of the diet of the inland indians. Coastal indians preferred seafood (so do I, but an occasional rat is good chow).

Peace,

Ron Hood

>>> Would anyone care to venture a guess on how many acres of southern woodland would be required to support I have a small "camp" about 20 miles away. 7.5 acres. Has a nice house and a pond(in Texas this is a "tank"). I've often wondered if my wife and I could really survive on just this parcel.

First off, not enough hardwood to keep fireplace fueled. Second, too many pines, so not enough "meaty" animals. You can't live on rabbits only.

Parcel is surrounded by commercial tree stands(paperpulp), Deer do visit the pond.

My wife did farm a 1/2 acre plot and she produced far more than we could

use...but farming is a full-time job, esp. if you grown and perserve the produce. Life's really too short, when it's just as easy to visit the local store and purchased needed veggies, ect.

Now, the above is nothing like being out in the wilds, trying to survive.

Having done my share of hunting, fishing, ect. I finally realized that it takes a certain amount of energy output to collect the "fuel" you need to just keep going. Those of you who have been in the wilds and have survived must really appreciate just what it takes to barely survive. I don't think living "hand to mouth" is surviving with comfort...IMHO.

That's cityboys for you:)

I've lurked on the Tracker list and note that there is a disturbing tendency to deify Tom. That led some on the tracker list to take shots at Tom for being a hipocrit because he managed to get hooked on cigarettes. I have a collection of his field guides among other guides (including the pocket sized one by LDO) I've also read a few of his other books and found them entertaining. I figure at the very least his books can be considered a source, but as with all written works not to be taken as hard fact until you have tried the techniques. I like to look at several different sources before I try something out. I guess the point is that we don't need a backwoods guru as much as we need a fellow seeker of primitive technology. Since Fred Paleo or Hary Neanderthal nor Ishi are here to show us what they learned from nature's labratory, all of us are trying out primitive techniques, learning from the trying and passing on what we learn. No one source, even when they combine spiritualistic practices(or especially, since there is no more destructive war as a religous one) should be seen as gospel until you have tried it out yourself. If it doesn't work go back to the teacher and see what he did different. I don't care if there really was or wasn't a Stalking Wolf, it makes a nice story, but since I never met the man myself I cannot argue his existance. I am glad that this list keeps the sticky spiritual world out of discussion, except it seems the spiritual release of passing a brown steamer. ;-)

If TB wanted to be a part of this list he would be here and be welcome, just as the other Tracker members are welcome. Argue for yourself, not TB. Let TB talk for himself, or not. Sorry for the meandering dialog folks.

It's interesting that you say you can "play both sides of the issue," but  
yet you state without reservation that "always peace - anything else is war."

Maybe you should start a conversation about proper hygiene of your upper lip.

I hear Ron Hood teaches a great spine growing class.

Whew!

Thanks folks. There are many paths....Simply taking TB's classes does not make you a "Brownie", you are a student (as are we all). There is a more sinister problem, not of Tom's design. "Cult...admiration of, or devotion to, a person or thing especially as a form of intellectual snobbery" (Webster dictionary). These are the "Brownies". Visit the tracker thread.....

>I personally take the position of  
>many teachers, many lessons, and walk my path. But then I have always  
>done this. I have learned much from Tom Browns books, the Kamana, this  
>thread, the tracker thread,,,,,etc.....

And

>Did I miss something? I wasn't under the impression that anyone was  
>upset. Maybe I just don't have my psychic antennas out....I thought  
>each was just sharing opinions on their viewpoints.

Sherri

Exactly! There are many leaves on the tree of "lives" and you need to visit each one of them to understand. Sherri, you've got the essence of my argument. To stay on track in this group we need to focus on the skills, not the personalities. Still we cannot allow one philosophy to dominate..... Including mine.

>Ron, I'm only insulted if I'm considered a rabid brownie just  
>because I took one of his classes.... ;)

NO!

>By the way, I think Tom does shudder at what he's become. He often  
>told my class how much he hated running the school, adding that he  
>felt an inner compulsion (vision) to continue doing so, even though  
>his druthers would be to go live a more interesting life in the  
>Canadian Rockies.

>

>He also told us (I was there last May) that the Tom Brown in "The  
>Tracker" is dead, so I guess you and he are pretty much in  
>agreement.

I agree. Sometimes the compulsion to prosletize overwhelms good sense. This is why I use the "Androgogy of wilderness learning" (it's on our web page)... as a vehicle to organize survival learning. How you clear the "Panes" of your understanding is up to you to determine. There is at least

one great teacher for each pane.

>If you, or any teacher you know, offers any full-immersion,  
>long-term "living off the land" programs where a "graduate" would  
>really be able to do it, I'd be grateful to hear about it.

Try to find; Larry Dean Olsen..... Larry is VERY good and used to offer long term survival living skills. He is also surprisingly good on the philosophy. I haven't seen him for several years but if I do contact him I'll send you the contact information (with his permission).

Finally, The only way to discover if you can survive is ... to do it. I'm putting together a guide to "survival camping" which I'll post when I'm finished. Essentially what you do is provide yourself with an "escape capsule" if your survival practice dose'nt work or you notice that you are harming the land. Confidence comes with exposure.

Let's get back to the techniques..... they are much more fun!

Peace,

Ron Hood  
Hoods Woods - <http://www.survival.com/~diogenes/>

I wrote this up last August, intending to mail it to the trackers list, but never did, though I showed it to John Wall and Mark Zanoni. It tells about my (bad) experience with Tom Brown. Since then I have heard more about TB and believe, at least, that he has a great deal of skill.

I think there are three reasons why so many people want to knock Tom. One is his incredible claims. Two is his ever-increasing popularity. Combined with one, you get the suspicion that he is deceiving a lot of honest, earnest people. Three, and most important, is his tremendous ego. Maybe if Tom Brown did not feel the need to raise himself up so high above everyone else, others would not feel the need to knock him down. People protest that Tom Brown tells his students not to take his word for anything, but the fact is that he tells you his stuff is fantastic and everybody else's stuff is at best good.

Or maybe it's just his personality. Can you imagine anybody getting upset about something, say, Paul Rezendez said? No, because you could still have a beer with him.

Phil

"It's very difficult being in a band with God's messenger."

Is Tom Brown for Real?

August, 1996

Copyright 1996 by Phil Goetz.  
Please do not re-distribute on mailing lists, newsgroups, or web sites.

After seeing how many people are struggling to puzzle out whether Tom is for real, I decided to share my experience with Tom.

First, though, I must tell you two facts about myself. The first is that, as long as I can remember, I've wanted to live off the land, and to know nature, even though I never lived in the country and never met anyone else who shared or even understood this desire. Second, I was once Christian, but became a materialist. So I understand the longing for spiritual rightness, but gave up hope that any such thing exists.

I didn't have much access to wild lands, but I did have access to books.

I studied field guides, survival manuals, anything I could get my hands on. I read five of Tom's books. I didn't believe everything in them, but they revived old hopes that I had thought were dead. Last year, I found out that Tom was giving courses, and I called up right away and reserved a place in the next Standard. I remember poring over Tom's catalog, calculating how many years it would take me to get the time and the money to take all his courses.

So I arrived at the farm in early August 1995, eager to learn, determined to tape every word and study it twice. But as the class progressed, I grew more and more uneasy. Tom was too slick, too intense. I could not shake myself of the thought that he didn't talk like a teacher or wise man, he talked like a con man. The way he spent so much time hyping his courses, and putting down others. It seemed like a well-rehearsed show.

Some things set off little warning flags in my mind. Like, why was it that no one else had ever seen or heard of Grandfather or Rick? How had the tracker moved through the world without leaving any tracks of his own -- friends, family, anyone to verify the things he said? Read his books -- notice he never mentions details about his home life, making it hard to verify his identity. "Tom Brown, Jr." is a convenient name -- every town must have a Tom Brown; mine has six of them. Why did Tom feel the need to not just put down but cast as an idiot every other survival expert in the world? Why did he discourage his students from asking questions, or from trying to improve on his methods? (I teach college students myself, so these last two struck me as especially perverse.) Why was Tom a chain-smoker? There's no wild tobacco in the Pine Barrens as far as I know. He said that he began chain-smoking the day he left the woods, to cope with the stress. But in my experience, nobody begins smoking that way -- cigarettes naturally repulse humans, and they must be socialized into smoking.

Some things set off big flashing red warning lights in my mind. Like his claim that he doesn't bother to track on foot anymore; he tracks from a helicopter flying at 30 or 40 miles an hour. Like his claim that he would teach us to make ourselves invisible, and that he would prove this in one class by having us camo ourselves up to look like wild men and stand beside the road, and people would drive right by -- well, I'd drive right by, wouldn't you? Like his claim that he would teach us to fight using something like the Force, and prove it to us by blindfolding us and then having us fight an instructor with something like a quarterstaff -- too easily faked.

When Tom came out with some new outrageous statement -- he would teach us to spirit-track, so we would just touch a print and know where the animal was -- the only audible reaction was "Wow!" I was as stunned by the way people immediately accepted everything Tom said as by the things he said. There was a guy there that week who gave Reiki classes in Australia on how to heal using your inner forces. He claimed to have healed severe, life-threatening leg wounds with his bare hands. The other class members ate it up. I asked him if he ever demonstrated healing an open wound in his thousand-dollar classes. He smiled and said no.

Tom never demonstrated anything, either. The whole week I was there, I did not see him track one animal, or do one thing that demonstrated any of the abilities he claimed. The only thing he did was to set up a course of grass

tracks for us to view. This was a set of spots along a trail, at each of which there were a few bent blades of grass which he said were tracks. But he didn't let us watch him find these tracks, nor even warn us that he was going to, so we could look for them beforehand. We didn't know about it until the whole thing was laid out for us. He might have made all those marks with his fingers.

What made me lose faith in Tom, though, wasn't these logical considerations, but two moments when Tom looked into my eyes.

When he was telling us about track measurements, he explained that a right-handed person takes a longer step with their right (left?) foot, and you could measure this difference in stride lengths, then figure out which way they would circle. I scribbled some calculations in my notebook, raised my hand, and asked, "Tom? With the examples you've given us, the difference between length of left and right strides would be at most half a millimeter. Can you really see such a small difference?"

He stopped, pinned me a moment with that cold, alpha-wolf stare of his, then said, "Yes." Then he resumed his talk.

Now, the answer to my question is clearly, No, or at least, No, not unless you make about a hundred measurements and average them out. (See appendix for the argument.)

But that's not what bothered me about Tom's answer. When he looked at me, in the second before he said "Yes", what I saw in his eyes was not consideration of my question, but a threat evaluation. And when he said "Yes," it sounded like a lie, or more precisely like something apart from him, the truth or falsity of which meant nothing to him.

I can't explain why this brief moment meant so much to me. I don't expect you to be swayed by my recounting of it. I wouldn't in your place. But in that instant I began to think that Tom was not just exaggerating or deceiving himself -- he was capable of deliberate lies.

The second occasion was a time when Tom was hanging around in the barn after a talk. I went up and told him about some folks at MIT who studied insect tracks. They had developed an array of devices to study walking as no one ever had before: photographic and pressure-sensitive methods to record insects walking, and measure exactly how much pressure each part of their feet applied, where, in what direction, and when.

I had thought that, as a tracker, he would want to know more, maybe build a similar device and walk across it. Or maybe he would dismiss it, saying, "Sand is the only pressure-sensor I need." But he said something like, "Yeah, amazing what they can do now." And he said it in a way that told me he did not care one whit what I was saying, it was just student-chatter and it was bouncing off him like rain off an umbrella. I was stunned that he had no opinion, positive or negative, of these new developments in tracking. It made me suspect that he didn't really care about tracking at all.

I tried to find some evidence that Tom had done the things he had claimed. He was very evasive about specific cases, never giving a place or a date, and saying only that he had tracked for the New Jersey State Police and for the FBI. I called them, on the payphone in the barn. The New Jersey State Police department of missing persons said, yes, they knew who Tom Brown Jr. was, but no, he had never worked with the State Police. The FBI was either

very secretive or very confused; I was bounced from department to department without finding anyone who could confirm or deny that Tom Brown had ever worked with the FBI. I did talk to someone who worked on tracking cases, and he said that as far as he knew, the FBI always used dogs. He had never heard of a dogless tracker working with the FBI.

On the last day, it was time to sign up for the back-to-back. I had intended all along to sign up, but as my doubts had grown, so had my reluctance. I earn \$9800 per year as a teaching assistant, before taxes. It costs me over a month's pay to attend one of Tom's courses, and now I was considering signing up for two. I had already decided that Tom mixed truth with fiction, probably because it sold better. I was willing to accept that, to sort it out myself. But before I laid out two months' pay, I wanted to know that this would go somewhere, that Tom really knew what he was talking about.

So far, the evidence was not good. I doubted very much that Tom could teach me to track mice across gravel in the one remaining lesson. Tom said no student of his had ever failed on a tracking case, yet I didn't feel able to track anyone. Were Tom's claims for his other courses equally vacuous? I didn't know about the skills courses, but I didn't need to attend his philosophy courses to know that his claim to be able to destroy any opposing philosophy in one week was untrue.

I was by this time highly skeptical of everything Tom said. The only solid evidence I had that Tom even had skill at tracking was a few bent blades of grass. On the grass-track course, at one alleged rabbit track, the person showing off the track had pointed out where the grass was bent more or less in the shape of a rabbit's rear feet. I studied the ground, and I found what could have been the print of forepaws, further off the trail, right where I expected it. If Tom had bent the grass himself, surely he would have pointed it out. But then, maybe Tom had pointed it out. I didn't know. I was shown the track by a student who was shown the track by a student who was shown the track by Tom. And then, maybe Tom would have been extra-thorough in track-creation just for people like me.

I wanted more information. I asked a couple of the instructors what sorts of things they had seen Tom do, but didn't get any specific answers. I reasoned that Tom might decide not to let me into the advanced class if I asked too many questions, but only if he really was a fraud. So Sunday morning, when he was hanging out by the Hummer, talking with a couple of students about his daughter and other things, I joined in the conversation. After a little banter I asked if he was going to demonstrate any of his tracking skills. He said indignantly, "I don't do dog-and-pony shows." I asked who he'd worked with in his career as a tracker. He only said, again, "I've worked with the FBI." I asked if he had any clippings.

I tried to ask this in a conversational manner. But Tom didn't fall for that. He frowned, then said, "Come with me." I followed as he turned and walked into the trailer with the office. Without looking at me, he went up to the desk, told the woman behind it, "Write this man a check for \$660. Then memorize his name and face, so you can see to it that he never comes back here again."

He acted angry. He said I was insulting him and insulting Grandfather. I did not mention that he was insulting me by expecting trust he hadn't

earned. I didn't say much of anything; I left like a whipped dog.

What do I think about Tom Brown, Jr., now? So many things about him are inconsistent with his stated mission as a teacher -- his refusal to demonstrate his skills, his lack of interest in his students and lack of desire to be around them, his tremendous ego, his scorn for other schools, his exaggerated claims (which I've since heard two other complaints about on the trackers list), his intolerance of questions, the fact that he doesn't even seem to enjoy being outside but usually hides in his house -- and consistent with the hypothesis that he is a con man. How can you claim to teach tracking, but never take your students out tracking?

Add to that the fact that his reputation is based mostly on events recounted by him, with no corroborating witnesses. Add to that that when I checked out the only claim of his that I could, tracking for the NJ State Police and the FBI, I came up empty-handed. But more than all these things, I see the image of Tom, his back to me, saying in a perfectly calm voice, "See to it that he never comes back here again." No warning, no chance to explain. He did his best to make his stories unbelievable, then punished me for not believing. Why? I don't understand why a teacher would do that, unless he had something to hide.

This is, of course, the easiest conclusion for me. If I believed that Tom Brown held the key to a new reality, and he had singled me out to deny me entrance, I wouldn't be able to sleep at night. If I accepted everything Tom says as true, I would have to completely change my way of life, my goals. I would have to throw away a belief structure that I have spent years constructing and revising.

I will not do that without strong evidence.

But strong evidence is what Tom refuses to provide.

I know some people have seen him do remarkable things, or talked to people who have seen him do remarkable things. I don't know how to explain in particular something Mark Zanoni told me, and it bothers me.

But you have to scrutinize claims like Tom's. Let me give you an example: Harry Houdini was on an ocean liner once, and the passengers prevailed upon him to give them a magic show. He asked people to write a question for him on a sheet of paper. It so happened that Teddy Roosevelt was one of the passengers, and he wrote the question, "Where did I spend Christmas?" on his sheet of paper. Houdini put that paper between two slats of wood, tied them together, did some hocus-pocus over them, and when he pulled them apart, there was a map of South Africa with an X on the spot where Roosevelt had spent Christmas.

Pretty impressive. But it was a trick, not magic. Houdini explained how he had drawn the map ahead of time, and how he had influenced Roosevelt, one of the most brilliant men alive, to ask the very question that he did without Roosevelt's knowing it. How can you detect something like that? It's pretty damn hard. You can't begin to verify any claims of powers or abilities without the full cooperation of the claimant. I do not think Tom will ever submit to such a test. I would like very much to go out with one of Tom's advanced students, and test these matters for myself. But until I do, I'm not going to lose sleep over it.

How do I feel about Tom Brown? Angry. Bitter. I came out of New Jersey

with a great week of training and no money out of my pocket, so I can't say he cheated me. But he gave me hope, and then he crushed it. I wanted to believe in Tom. I suppose I still do, or I wouldn't waste so much time on this letter. I'm angry at Tom because I had wanted something so badly, for so long, and Tom Brown offered it to me and then snatched it from my grasp. Was he a fraud, afraid of exposure, or a teacher so jaded and indifferent that he could throw students away on a whim? I don't know which is worse. I'm angry at myself because I only want to know the brush and the forest and myself with them, and it shouldn't matter if my teacher livens up his teaching with fancies about spirits. I'm ashamed because I needed the money. I never would have pushed him if I hadn't been worried about the money. I felt dirty cashing the check, like Judas, trading in his spiritual leader for some ready cash, reducing a spiritual quest to a financial transaction. I'm bitter because now I'll never know what I lost.

Phil Goetz@cs.buffalo.edu

APPENDIX: How many measurements it takes to tell which way someone is curving

I walked along a muddy riverbank and then measured the differences between the heel-of-right-foot-to-heel-of-right-foot distance and the heel-of-left-foot-to-heel-of-left-foot distance, throwing out all measurements over 1.5 inches. The standard deviation was then 1.78 cm. This is too large to account for by errors in my measurement. This means that to know the average difference between right-right and left-left footsteps within .5mm with a confidence of 75%, assuming a normal distribution of differences and that you could make perfect measurements, you would need to take enough (right to right) - (left to left) pairs to reduce the standard deviation of the average from 1.78cm to  $.05/1.15 = .0435\text{cm}$ . (That's because to have a 75% confidence that the value of a random variable will fall within a certain distance from the true average, you need to go out 1.15 standard deviations above and below the average. In this case the random variable is the sample average of your (R-R)-(L-L) measurement, the average is the true average if you followed the tracks forever and kept measuring, and the 1.15 standard deviations is supposed to come out to be .05cm.) The standard deviation of the average of a sample is the standard deviation of the sample divided by the size of the sample. This means you have to measure  $n = 1.78/.0435 = 41$  (R-R)-(L-L) pairs; that's 82 measurements.

I just wanted to add a perhaps less practical note to the idea of the 'Happy Wanderer'. Where happiness is involved, you also have some psychological states as well as physical requirements. Bruce Chatwin in 'Songlines' felt that wandering as such was man's instinct, and that stasis, settlement of a permanent nature, was tantamount to metaphysical decline. Chatwin was an 'amateur', and sometimes eccentric in his views, but I feel there is an element of truth to this. What do others feel about the real, 'hard-wired' need for the Walkabout?

Cheers,

Mike.

> this. What do others feel about the real, 'hard-wired' need for the  
> Walkabout?

A Walkabout or some type of wandering, be it for the day or for several days, allows me to recover from the stresses of my job and from just being around people. I define the Walkabout as not necessarily just by foot, but by foot, by canoe, by bike, by whatever. Often I solo, but sometimes I'll invite along a friend who also likes such treks. We may not talk much, or we may, but we both want to get away from "civilization" (at least that's how we put it). The best are those of a few days. What gear we take depends on the circumstances, where we're going, and the expected environment. Sometimes we take a lot, sometimes just the bare necessities, again it depends on what we feel like doing. These are rarely, for us, survival-type treks, though. We might take some stuff from the land and waters we travel, but we also bring stuff with us. While not necessary to the need of the Walkabout itself, I or we also practice the gentle art of minimum impact, of leaving no trace of having been through here. For some reason, at least for me, doing this seems to enhance the Walkabout for me. I know the Walkabout more as a Caamoraan, a soul-cleansing. For me, life would be difficult without the chance to take such a trek once in a while, usually once a year at least. I'm not anti-social by any means, but I sure do need to get away from people at times. Never bothered to rationalize it out, it's just something I need.

Bill B.

As someone said, there are two kinds of people... In this case, I count them as being those who really like predictability and status quo (or don't like risk and change), and those who really like some excitement and change (don't like predictability and status quo). My exact choice of words (risk, change, excitement, etc.) may not be the best, but I think you get the idea.

The first type continue to draw inside the lines, report daily to the factory, neatly trim their lawns, etc. I.e., many of them make up the bulk of the typical law-abiding folk that make up a large percentage of the world's population, whose families have lived in the same town (maybe even same house) for generations. Nothing wrong with that, if that's who you are.

The latter types, though, are probably the ones who were more likely to walkabout, sail unknown oceans, rob banks, write graffitti, climb tall mountains, invent airplanes, etc. Those types tend to stress the rest of society in one way or another, either for better or worse, since the tendency can be inherently "bad" for society (theives, vandals, etc.) or at least distressing (but.. but.. we all KNOW the world is flat, so why is this crazy guy trying to sail west to get east??? Of COURSE the sun revolves around the earth, so excommunicate the clown! Law abiding citizens should hold meaningful full time jobs, so what's this goofball doing playing boyscout in the woods--hey, is he having more fun than I am???)

But then, those are just my thoughts on the matter.

Hi Barent,

Sorry, but PHILOSOPHY ISSUES ARE NOT TO BE DISCUSSED within this group!  
Nor are subjects related to any particular political, religious, or  
other belief-based considerations. Thank you everyone for respecting  
this important guideline.

Your question itself is nevertheless valid, and you can learn all you  
want about Tom Brown's philosophy at the following Web sites, and can  
even discuss it to your heart's content by joining the Tracker list  
there:

<http://members.aol.com/trackerinc/index.html>  
<http://www.csee.usf.edu/~gulleddge/tracker.html>

I will not attempt to summarize or comment Tom Brown's philosophy (even if it itches me to do so), and I encourage everyone else to refrain from doing it also. Sorry for being so firm, but I really think we would be swaying dramatically from the groups purpose by allowing this.

Barent, please note that this is not directed to you personally in any way whatsoever. Thanks for understanding.

Andr 

PS Nothing preventing anyone from answering Barent directly if they wish...

I have seen references here and elsewhere referring to "Tom Brown's philosophy...". Could someone explain that philosophy to me. I think that the "why" is often as important as the "how" because it so often colors the logic involved at arriving at the "how". It seems that Mr. Brown's view differs from others in the field and that this is a major point of contention. I may even be familiar with the man's work and not realize it, having forgotten his name or not connecting it with something I've read. I would appreciate any help you may give on this.

Andre,

I do understand. Won't ask again except by private e-mail. Will note that Mr. Pressley made mention again, probably prompted by my post, of Mr. Brown and his methods. I was pretty quick to pick up on this undercurrent of partisanship on the part of members. Some is undoubtedly related to their competing for their livelihood (true survivalism). ;) I just wanted you to know that I am not in the least offended, as I said before I can be blunt to the point of causing trauma! Thanks for all your help and a very enlightening group!

Hi All,

Will add my little tibit to this.....I personally do not care who first

came up with what or from what source it came from. All I care is...that it works. There is too much of, "this is not that persons material". These things are better addressed by the "Spirit that runs thru all things"...let us be at peace with this.

No matter where Tom did or did not come up with his stuff; he HAS gotten alot of people interested in the primitive skills and their connection back to nature. Including myself. I was connected to nature but his books sent me on a whole new tangent that I am passionately involved in. This is a good thing that has come about thru him irregardless of the hows, wheres or whys.

Sometimes the small things can just bog us down. I say, lets not worry about these, let us be glad for whom comes into this awareness no matter how, because in the whole scheme of things...that you got here is what is the most important.

In Peace,  
Sherri

I have been reading with great interest the exchange regarding Tom Brown. I have only read his books, and have not met him. The comment was made, I believe by Sherri, that we should not dwell on this topic because it really does not matter. While I agree that our primary goal should be to exchange information about primitive skills, I have to say that I think the issue of truthfulness in Tom Brown's books regarding his background is an important topic. It is to me at least, because I have signed up for his standard course this April. If he has, as Ron Hood seems to be saying, fabricated Stalking Wolf and all those hundreds of stories of his boyhood, how can I trust what I learn from him? What is to stop him from fabricating other things, such as techniques on which I might someday stake my life? I would love to find out that Ron is wrong about this. I for one would like to see the dialogue continue, and especially I would like to hear from anyone who has first-hand information that can put this question to rest.

> If he has, as Ron Hood seems to be saying, fabricated

>Stalking Wolf and all those hundreds of stories of his boyhood, how can I  
>trust what I learn from him?

Two thoughts.

One) I am not saying that they were fabricated, I do not know the truth.  
Only Tom knows. While they are questionable they could be.....

Two) Take his stories as lessons. Depersonalize them and just take from them  
the wisdom they contain. When he says "I" think "The man..."

My sensei told me a story of a samauri who fell from the edge of a huge  
cliff. As he sped by the rock he spied a single small tree sticking from the  
sheer cliff. In a desperate grab, he caught it. He stopped falling. Hanging  
there by a single hand he looked up the cliff, it was unclimbable. He looked  
down, hundreds of sheer feet to a raging river bounded by sharp rocks.

He looked at the tree he was holding and there, in the middle of the root  
system was a single strawberry plant with one large red strawberry. He  
picked it, bit into it rolled his eyes back and thought "so sweet....."

Enjoy the present.

Tolstoy had an even more perfect story. The emperor's three questions. It's  
much too long though.

> What is to stop him from fabricating other  
>things, such as techniques on which I might someday stake my life?

I do not believe that anyone would fabricate techniques. I have not  
questioned Tom's skills. You will get what you want I'm sure. Before you  
stake your life on your skills, practice, practice, practice what you learn,  
learn, learn.

I doubt that we will ever resolve this debate, it's an exercise. Tom pinches  
steam just like the rest of us, yet some folks see him as a prophet of some  
sort. I'd hate to be in that position.

Thanks for your thoughts!

Peace

Ron Hood

I hope at least this won't be a problem. You will surely practice  
techniques under controlled conditions before you stake your life on  
them... This no matter from whom they are obtained.

I rarely input into lists because I have much to learn and little to contribute in comparison to others. I appreciate these opportunities to increase knowledge and techniques as well as enjoy different opinions. It helps one to keep things in perspective. BUT THIS IS GETTING RIDICULOUS!

The more you argue Tom's window dressing ( this is what I call all the extra information that has nothing to do with the basic skills he teaches ) the more you build up an aura and mystique around a human being who is teaching something valuable but is nothing more than one of many who does the same thing.

About three years ago I had absolutely no involvement in primitive skills whatsoever except a growing passion for herbalism. I am an avid reader and stumbled upon one of Tom's books. I read them all within the next three months and found myself introduced to whole new philosophy: a concrete approach to all the ideals so many of us seem to hold. Myself, my husband and two friends decided to take some of Tom's courses. Yes!! we learned totally new skills that were alien to us at the time and found that with practice they work! Some concept!! They work! What more can you ask of a teacher. We have also taken some other courses with other people who have taught us a great deal also. Those skills also work!

Need there be more. Can we not leave our teachers to their own lives and stop making them into something they are not and do not want to be?

Sorry for taking up so much time!

Sue

Dear group,

Ron and I have taken our discussion of you-know-who off line. He responded to my last post privately, and we will not tie up the group's bandwidth with further discussions of you-know-who. Hope you are all OK with this. Ron and I have great respect for one another and there seems to me to be nothing but great feelings between us.

On the sour side, Ron has spoiled one of my favorite traditions. I am heading for the East Coast for a week or two very soon, and whenever I get to the beach, I order a platter of fresh steamed clams appropriately called STEAMERS on the menu. Alas I am afraid I can never look at them the same way again! Imagine driving down the island and seeing signs in all the eating establishments for FRESH HOT STEAMERS! Yikes! Perhaps I'll send Ron a couple of steamers via the mail. Probably wouldn't smell too good by the time they got there though.

If I have a chance I'll say goodbye, otherwise I be in touch in a couple of weeks.

Kevin

Or like when you pass a roadside place that has a big sign that says, "EAT! GAS!" Not to appetizing, but low-level grunt funny.

It is a dream of mine, also, to have such a community. I tried to get some interest up once, long ago. It seemed to be the kind of thing that no one could really agree on all the rules and the ones that could didn't have the land or the money. I do know one person that has been

fairly successful at achieving this in the mountains of NC. His wife inherited some money, though and they bought land. They are trying to build a small community and retreat center. The ones who live there own their land but agree that if they move that it must be sold to someone that has similar convictions for their project and there is a certain portion of the land that is agreed to belong to the community as a whole for an educational and living center. They rent cabins, Teepees and teach classes there. Good luck to whomever seriously pursues this. Keep me posted if you have any success.

fear to upset the brownies who scream in defense of their >guru.

I think this is partly true. I have taken a class from Tom Brown ( a good class, I  
might add, back in the  
days before 100 person Standard Classes), I have also taken many classes from other  
people some of whome  
make no bones about their dislike of Tom. I also have friends who count themselves  
(and rightly so) among  
Tom's few friends. More interestingly, I have found myself being asked to teach  
classes for groups of Tom  
Brown students and have found myself in the middle of just his kind of discussion. It  
is a bit curious how  
it is that TB has become both so deified and so hated. I'm sure it's something he  
dislikes as well and  
from what I hear, he spends a great deal of time and effort trying to insulate  
himself from the worshipping  
hords. Interestingly, I believe that this worship is in direct conflict with what he  
teaches, but doesn't  
it always seem to be this way.

The more interesting discussion, and one that would serve us better on this list  
would be one having to do  
with teachers in general, and primitive skills teaching in particular. My experience  
is that all the  
pitfalls and problems of teaching get amplified when primitive skills come into play.  
They are great  
mysteries to most people in this culture and, strangely, have the tendency to both  
attract and repulse.  
People tend to look at someone who can do things like start a fire by friction or  
find and read tracks as  
if they are creating miracles. It is so far outside the realm of most peoples  
experience that they either  
worship of the feet of the practitioner or run screaming for the hills. Many of  
course fall somewhere in  
the middle, but examples of both extremes are extremely common.

I've been a teacher for around 10 years. It's at once the most rewarding and most  
difficult thing I have  
ever done. There are also tremendous pitfalls that every teacher needs to overcome at  
one time or another-  
ego being the most powerful and potentially damaging. "Tom Brown"- both the man and  
the legend- would be  
useful to examine as part of this. How does someone in his position exemplify both  
the good and the bad  
ways of dealing with this? How do we deal with this and the many other issues that  
come up- not the least  
of which is the tendency to both be compared and compare ourselves to people of Tom's  
stature (whether or  
not you believe in his abilities)? I would be very interested to hear about this from  
others in the group.

> Our exchanges were meant to draw out the strident  
> screams of indignant brownies, leaping to the defense of..... Not of  
> Tom..... but of their own ex halted vision of the poor man.

This may be partly true. I certainly have seen hackles raised when someone would raise even the mere suggestion of Tom's humanity. I think, though, that there is more to this than meets the eye, although I don't feel like I want to touch that "snake" here. More than that, though, I do question why it is that you feel this ("draw out the strident screams of indignant brownies") is necessary to do in the first place. There seems to be a sport developing in certain circles of taking every opportunity to rip this guy and his students to shreds. This is the part of all this that pisses me off. Tom has a lot to teach. So does Larry Dean Olson, Richard Jamison, James Halfpenny and other detractors of his that seem always on the ready to twist in a cheap shot here and there (Larry being the worst with his statement in the promotional section of his book saying that he is "the true Stalking Wolf" or something to that effect). The cheap shots detract from their teachings in my opinion, making me question thier credibility as much as they seem to constantly need to question Tom's. My opinion is that those that do know, don't say. They certainly don't cut others down. That's a child's game that, for the good of the science and art of skills practice needs to stop! I have often speculated what a wonderful world it would be if, to give one example, Tom Brown and James Halfpenny were able to sit at the same table once, put differences aside and respectfully talk about their unique approaches to the art of tracking. I believe it would raise knowledge of the art to a level beyond what maybe even the ancients were able to approach. They each have a piece of the puzzle, in my opinion and may, in the end, find more to agree upon than not.

> >I'd love to ask him questions to see how he can weasel his way out of

> >those 48 people you mentioned made it through the 30 day winter survival  
> >course with no clothing? I'd love to do a piece on their  
> >stories.)

I have always questioned the existance of such a list myself, however, it matters not a bit to me one way or the other. Tom tells "stretchers", in fact former instructors says he bends or actually tells fabrications at times when he doesn't need to, and relate that it is very irritating. The personality traits of the man are legendary, however it in know way detracts from his skills, or what the man has done for this field. Even if the 30 day "Naked survival class" is reality, I wouldn't give a list of students away either. Would you?

> >I've been teaching survival for 20 years. I've never seen more ill educated  
> >persons than the ones TB turns out in his assembly line school. None of these  
> >people has any clue about the real skills of wilderness survival.....

Well, here is a thing I will find a slight bit of agreement with, although the short sightedness of the statement is self evident. I to have been amazed at the limited ability of some of the Brown students who seem to use as the proof of their abilities the number of classes they have taken rather than actual practice. The opposite is also the case. There are some damn good practitioners out there who taken classes from no one else but Tom. The problem is that I find the same kinds of people when I encounter those from from other schools too. Completion of BOSS's 27 day "Walkabout" is no more proof of survival abilities than having taken 20 Brown classes in a year. As someone who rarely takes classes, but spends a ton of time in skills practice and application, both of these kinds of people irritate me. These people are a dime a dozen, however, all over the place. You can find them at mountain man rendezvous' where it seems to be more fun to pretend then to practice and you can find them at most places where hunters and other outdoorsmen gather. The situation is the same- long on talk, short on practice and you damn sure can't show 'em anything new. They know it all! The problem is it doesn't have anything to do with the teacher, in fact they dishonor the teacher every time they open their mouths. It has everything to do with the student, though. Everyone wants the easy soft way it seems and it's a lot easier to talk then to do.

> >I can't for the life of me imagine how anyone can think that they will learn  
> >anything about the wilderness when they sit in a group of a hundred  
> > people while they listen to a grown man moan about how bad things are.  
> >People just get ripped off... and the funny thing is... they love it!

If this were the case I have a hard time figuring out why people keep coming back class after class. There's a hell of a lot of repeat customers at the Tracker school. I know a lot of people, also, who started off thinking the guy was yanking their chains and learned some very powerful lessons that changed their opinion. None of these people would at all be anything remotely approaching gullible. There certainly are gullible students there, though, just as they can be found anywhere. I have a hard time believing that many of them stay long.

As far as the statement about "listening to a grown man moan about how bad things are", you could find a lot more like him on any Indian reservation you would care to visit. The philosophy that things are indeed

going to hell in a hand basket is fairly common and in fact it doesn't take much of a genius to see the truth in that opinion.

> > How can anyone take  
> >seriously a 'teacher' that teaches "Spirit Tracking" and tells people  
> >they can touch a track and tell what direction an animal was looking and  
> >that they will no longer need physical tracking skills once they take  
> >this course.

Now this one pisses me off, mainly because I've had enough powerful experiences happen while tracking to believe without a doubt that "spirit tracking" indeed has to have a good deal of merit. Also, Tom isn't the only one that teaches this or believes in the validity of it. Unless they are wholly a left brain, analysis type tracker (and I can't believe you could track for long and remain that way honestly), it isn't possible to spend the time it takes to learn this art and not touch something that can't logically be explained. Even more than this, putting the possibility down is, in my opinion, an ultimate sin. What you do is close yourself off to possibilities, something no good scientist or artist can ever afford to do.

> >I've taken several classes with Tom. At some point I realized that I had

> >I could track a mouse fart. It became painfully obvious to me when I took a  
> >survival program in Colorado and I had no idea what the teacher was talking  
> >about.....

I would be the first one to admit that the skills teaching that takes place at the Tracker farm is hit and miss. With so many people around it is so dependent on the quality of the assistants, which seem to change frequently, and details do get lost in the shuffle. I'm living proof, though, that if you are diligent, persistent and dedicated enough you can take what you learn there and make it work. I'd be the first one to say that it's not ideal and that I've gotten better quality instruction in other places, however, either way, it's what you do with it after the class that really counts. A good class can help, but it's now substitute for "dirt time". I think Brown would be the first to agree with this.

> For those of you who are too  
> fearful of the power Tom has in our little industry, I say "speak up".

Me thinks he doth protest too much! It gets a little old too.

> Remember too. Seeking truth requires facing facts, getting evidence and

Hi everybody,

I wanted to pose an issue to the group that I would welcome discussion on. The issue has come up several times lately and begs some consideration. Let me begin, first, by telling you about a discussion I had awhile back with one of my teachers (not the unmentionable one) about this issue and responses he has encountered with other very famous people in this field, journals and magazines in the field and thoughts we both have had on frequent occasions about theories on tool use, primitive skills and ancient life ways.

This particular person lives in an unnamed eastern city very near a well respected lithics and primitive tech. expert. They were discussing some theory on the use and manufacture of stone age weaponry and my teacher, a very adept and practiced tracker who does classes for many professional organizations and the general public on tracking and other primitive skills, offered the opinion that it was not possible in his mind, to know how a tool was used, or how it fit into the lives of ancient people unless you understood and practiced tracking. He was immediately told by this other respected primitive tech. person, that in his mind, the importance of tracking and its associated skills was "over rated".

I have given this point of view and its associated results a good deal

of thought. To me, the practice of ancient skills involves the necessary familiarity with a language. Among the languages that almost by definition apply here is, for lack of a better term, the "language of nature". My experience has been that this language is tremendously complex and involves immersion to be understood. When a person goes to the woods to practice skills we are thrown into a world that is radically different than our modern one. It is not too big of a leap to argue that the kinds of knowledge, information and ways of interaction that sustain us in the modern one are virtually worthless out there. Things like clocks, traffic signs, computers, etc. have no real natural world application. The natural world has its own rhythms and cycles that must be adhered to and, if there is a parallel for the traffic signs, billboards and other information that dot our landscape it would have been in the subtle markings, tracks, pathways and other things that make up the natural landscape. Understanding them, indeed even seeing them is not a given, in fact in my experience most people, even seasoned woodsmen, don't. I believe that learning the art of tracking and all its attendant skills of awareness, movement etc. are the key toward understanding what is "out there" and how we can fit into it. In fact it is the "language" of the woods, or at least a key to understanding it.

It has always mystified me as to how rational scientists can pose and construct theories about ancient peoples without understanding the reality that they lived in. Living in nature and understanding its laws and rhythms, by definition necessitates a different way of looking at the world. My experience is that tracking gives you that key. Tracking at the very least gives you a foundation upon which to test and utilize your theories. Making and using primitive tools is one thing, putting them into practice in real conditions is still another. Anyone who's a hunter knows how difficult it is to be successful consistently even under ideal conditions with modern weapons. Imagine if you depended only on the use of primitive tools and your knowledge of the woods for survival. Without a doubt it would require a totally different world view than most of us are familiar with, and most certainly a set of other skills and approaches. A key one would almost certainly involve tracking, especially if you lived in a harsh environment such as the arctic or the desert. Even modern observations of the Kahahari bushman or the aboriginals of Australia would certainly lead one to conclude that indeed, survival depended to an incredible degree on raising tracking skills to a high art. It wasn't just a nice little sidelight to know, it was the foundation of all your skills. Why then today would those of us that seek to follow in their footsteps, or at the very least understand their lifeways, neglect to learn those key skills that made their lives possible. Even worse, it would seem almost criminal to create theories about their culture without taking this factor and all its attendant aspects into consideration.

A couple of years ago, a theory was put forth that is now almost repeated as gospel in scientific circles about Pliocene humans in NA and their supposed involvement in the destruction of whole species of megafauna, most notably the mastodon. I have always found this theory to be almost comical in light of my experience in the woods. Beyond the fact that the theory throws out the window most of what is understood about predator/prey relationships, it rests upon one idea that simply does not make sense to anyone who has actually attempted to put primitive tools into actual wilderness practice. That theory being that

the simple development of the "clovis point" so revolutionized the capability of ancient peoples that they were able to hunt down and exterminate their primary prey at will. Ya right!!! This guy had no idea how it works and he certainly could never have actually tried to hunt and kill even a deer with a stone tipped spear, much less an animal the size of a mastadon. No matter how well made that tip is, even if he had an atlatl, it just would never have been that easy. The world doesn't work this way.

My theory is, had he been a tracker, and had he developed the skills to be a tracker and if he had spent the necessary mega hours in the woods it takes to develop that art he could never have come to the conclusion that he did. I would argue that first of all, tracking changes your consciousness (here we are at the edge, Andre'). It makes you aware of how ancient peoples, out of necessity, looked at the world. The world is big and complex (lesson #1). Animals are not "furry robots" (lesson #2). There are patterns and laws that must be adhered to in that big, complex world (lesson #3) etc. etc. Most of all, tracking probably would have lead him to attempting to test his clovis point theory under real world conditions on say a deer or other similar animal. He either would have switched his theory immediatly to one having to do with time travel and machine guns or, if he was intellegent (which certainly is debatable anyway), he would have gone on to look for more plausible explanations for how things came to be and left the "Indians", or at least their ancestors, alone.

I would be interested in discussing all manor of related issues here. Do you practice and/or teach tracking, awareness etc.? Do you do so with the assumption that this skill is foundational to the other skills? If so, why? If not, why not? What has your experience been learning the "language of the woods"? Was tracking a part of that? Why or why not?

>primitive skills, offered the opinion that it was not possible in his  
>mind, to know how a tool was used, or how it fit into the lives of  
>ancient people unless you understood and practiced tracking.

I wonder what the Chumash, coastal California indians, would think of it too.... They were fishermen and rarely hunted. Trap yes, hunt no. Their primitive skills were pretty good, they lived off the land. Fishermen rarely "track" their game. For that matter I wonder what any coastal indian group would think.

The Easter Islanders probably didn't do too much tracking. Not much to track on that island. They knew their world pretty well. The Gabrellinos, Fernandinos were recorded by the Spaniards as being poor trackers. Poor by Spanish scales.... hmmmmmm.... makes you wonder. Of course a good Spanish tracker was said to have been able to track a pigeon five days after he farted in the sky.

I know from my experience with the indians in the Brazilian Jungles, who do very well with their primitive weapons in hunting, can't track wet feet out of the bathroom. Their prey is in the trees, they look for movement. All of the jungle peoples I've met have been that way.

I doubt you'd question their understanding of the skills they rely on.

> It makes you aware of  
>how ancient peoples, out of necessity, looked at the world. The world is  
>big and complex (lesson #1).

It is simple, and is ruled by spirits with basic human motivations that the peoples could understand. Our world is big and complex.

>Animals are not "furry robots" (lesson #2).

I've never heard of an indian robot. Or a "furry robot". Can you tell me where that came from?

>There are patterns and laws that must be adhered to in that big, compex  
>world (lesson #3)

There are simple patterns and rules in a simple universe.

> Most of all, tracking probably would have

>lead him to attempting to test his clovis point theory under real world  
>conditions on say a deer or other similar animal. He either would have  
>switched his theory immediatly to one having to do with time travel and  
>machine guns or,

I want to understand how a deer can represent a mastodon. Have you ever SEEN  
an elephant hide? I doubt that there would be any usable correlation between  
your testing hypothesis and an actual test on a mastodon (using your time  
travel/machine gun theory).

.....> if he was intellegent (which certainly is debatable  
>anyway), he would have gone on to look for more plausible explanations  
>>for how things came to be and left the "Indians", or at least their  
>>ancestors, alone.

Excuse me, I don't understand why his intelligence is an issue here. Or for  
that matter how you can question it. If spelling were a test of intelligence....

Incidentally, we have a group of folks, A-N-T-H-R-O-P-O-L-O-G-I-S-T-S, who  
study these issues. In my reading, tracking skills have rarely been an issue  
in the success of a primitive culture.

I beg to differ on this point. The natives most certainly did/do "track" their fish. If you have ever gone to a new fishing hole that is a trophy fishing lake, and gone away skunked....you obviously don't know the lake or where the fish will be. That would take time to study where the fish will lie in the lake (or ocean), when they will be at those points at which times of the year. This applies to tidal fishing as well but you have to take into account a fishes migratory patterns. Coastal Indians just don't go out and "fish" they know where they are going (proven fishing spots), and when (depending on the season they will fish different areas for different species of fish).

Also, stating that the Indians trap their fish indicates some sort of analysis of the movement patterns of fish. I would call that tracking.

I have no idea what the seasonal patterns would do to the game that these people hunt, but I would hazard a guess that these Indians would also knew the migratory patterns and routes, or territories of the game they hunted. This all goes hand in hand with conservation of energy. If you know in January where the best game is going to be, you are not going to go and hunt somewhere else. The only way you would know where the best hunting would be would be by analyzing the movement patterns of the game you hunt, or tracking.

As for the first part of this statement, I would say that it is highly contradictory to assume that spirits have human motivations. I have never seen a spirit eat anything that I would consider for dinner, or contribute to the grogan pile, or go on a date on Saturday night. The last part of this statement does not make sense to me. You are both saying the same thing.

>  
> >There are patterns and laws that must be adhered to in that big, complex world (lesson #3)

Again you contradict yourself. If our world is big and complex as you suggest in your response to lesson #1, how can our universe then have only simple patterns and rules??

>  
> I want to understand how a deer can represent a mastodon. Have you ever SEEN an elephant hide? I doubt that there would be any usable correlation between your testing hypothesis and an actual test on a mastodon (using your time travel/machine gun theory).

It would be my conclusion, that hunting with a stone pointed spear would require a high degree of accuracy on the part of the thrower, as well as a close proximity to the intended victim, and a darn good, strong arm!! Would these parameters not be the same regardless of the animal being hunted?? It sounds like you have seen an elephant hide, so how thick are they?? If they are as thick as you suggest, then that makes using a stone tipped spear even more difficult, making the idea that Pliesticene humans eradicated an entire race of elephant type animals with these weapons even more ridiculous.

> Incidentally, we have a group of folks, A-N-T-H-R-O-P-O-L-O-G-I-S-T-S, who study these issues. In my reading, tracking skills have rarely been an issue in the success of a primitive culture.  
>

Have A-N-T-H-R-O-P-O-L-O-G-I-S-T-S studied tracking?? If they have, then I would love to know if you could provide me with a couple of book titles, I would love to read some works on tracking from an anthropologists point of view. If they haven't then I don't see them as being in a good position to comment on the relative success of a primitive culture in those terms.

Mark,

I submit that, due to the pervasive influence of man on the planet, it is practically impossible for any of us (are Canadians an exception?) to experience the "paleolifestyle". It seems to me that animal and plant life have been so drastically altered by man that emulating or reproducing the lifestyles of aboriginal inhabitants of even 250-300 years ago is impossible.

I agree that tracking is a necessary adjunct skill to use of the weapons.

However, one can argue that one must be able to properly identify, process, manufacture, use, track, process animal product, manufacture, and use in order to survive using these primitive methods of equal importance. Like a chain that is only as strong as the weakest link, each task must be performed successfully in order for the individual (more likely at least a small group) to survive. Just think of what you must be able to do to hunt with the atlatl, each and every step is a critical survival skill with no second place winner.

That is what makes this list so interesting for me, the diverse and numerous skills and methods for accomplishing the many tasks.

I am not saying that I agree or disagree with you just that I feel as I

have stated. I think that this would be a good thread as it goes to the root of what and why of the list.

I know the best trappers in QuÈbec. These guys are also scientific biologists and do research for the ministry of natural resources. For example, they have put collars on hundreds of wolves in Parc des Laurentides and have been following their movements. They do research on how trapping can be used to actually augment the faunal capacity of an area. Roland Lemieux of QuÈbec took over a trapping area 25km square and augmented his fur catches of fox from 1 to over 30 per year over a 10 year period. All of his other captures have seen similar jumps. His trapping area is now at a peak which he can maintain year after year.

Roland knows animals better than anyone I have ever met. He and his research team have studied animal tracks and scats scientifically and have published a great deal of material and videos on these subjects (all in french, sorry). I have spent time in the woods with Roland, exchanging survival tricks for trapping and tracking knowledge. Everything he has shown me is measurable, repeatable, understandable, and perfectly logical. Anyone can learn it.

Before I read the Tom Brown thread and looked at the Tracker archives, I thought what I had been learning with Roland Lemieux and through books such as "Field guide to animal tracks" was what learning tracking was all about- studying animal tracks and feces to learn about their habits. Now I realize that there is another dimension to tracking which many people practice, which refers to improving the individual's capacity to be "at one" with nature. This other dimension to tracking is a spiritual one which involves psychology and individual belief systems. We have all agreed not to discuss these issues.

Therefore, in accordance with the guidelines set forth by this group, I would ask everyone to limit tracking discussions to physical tracking skills. For example, to find out if there are muskrats in a small stream, you can look on rocks or logs which are sticking up out of the water. If there are muskrats, you will find scats there. The number of scats on the rocks or logs will give you a vague indication of how many muskrats there are in the area. Muskrats dig holes in banks which sometimes go to the length of 80 feet. This information makes us aware of the futility of digging for muskrats in survival situations. I would love to hear more about animal habits which would make their capture easier in survival situations.

However, I would ask everyone to please respond to those aspects dealing with non-physical tracking skills off-line. I insist.

Thanks for reading,

Andr 

I personally, agree with Ron andd Mark. There are other senses that can and do come into play. We, as a race, use these senses all the time in our everyday life. Some people are just more aware of it than others. I do not see how discussing this in line with tracking would cause any harm as long as we don't bring up the TB thing.

My personal points of observation on the \*tracking\* thread:

Seems to me this is like discussing what the best color is. We need to  
focus on one particular \*color\* and confer on its particular aspects.

>From the standpoint of a novice survivalist, I believe that the literal  
meaning of tracking be adopted out of respect for those individuals

who read the list and do not post (could be quite a few..:-))

One note: I believe Mark is talking about \*getting in touch with nature\*  
The finite skills of survival are critical to living wild, but in this day  
and  
age, and the environmental situation, respect for nature is at the least,  
a viable subject. Unfortunately, it may not be a subject that is politically  
correct to discuss.

I would gladly partake in any private discussion of this matter. BTW,  
without our precious outdoors, most of these subjects would be moot!

Perhaps one of you guys who run schools would like to invest the resources to translate this material and then sell it to the rest of us? I, for one, would be willing to commit to a purchase if it could be costed out realistically. Anyone with me on this one?

I don't think we need to bring that up to discuss it. It's not like he's the only teacher in the world that uses it in this context.

One further argument on this is that intuition and related aspects are becoming more and more accepted in many areas of society, Corporations are hiring trainers to work with employees to use these techniques to increase creativity and problem solving abilities, relieve stress etc. My experience with tracking is that you need all the help you can get from all parts of your brain, senses and physical body to get a handle on what's going on. Not being able to use them, or trying to talk about tracking without touching on them is similar to talking about starting fires with a bow drill but avoiding discussion of notches and wood types. It's just one more tool, and a much under rated one at that.

Mark

I think this is what we are all suggesting, if I understand you  
correctly.

> >From the standpoint of a novice survivalist, I believe that the  
>literal meaning of tracking be adopted out of respect for those  
>individuals who read the list and do not post (could be quite a few..:-))

I believe that the "literal meaning" as understood by most people (i.e.  
following a set of clear foot prints) is misleading and not very helpful  
in most instances. Tracking, is more a way of seeing than anything else  
and while it certainly can involve following a set of footprints at  
times, it usually isn't as simple or as clear cut as that in most  
situations. For "novice survivalists" I would suggest learning this  
skill as a first step. You may not understand why now, but I think you  
may find that becoming a good tracker will strengthen, enhance and give  
you a solid foundation for other skills that you need to learn.

> One note: I believe Mark is talking about \*getting in touch with  
>nature\*

Well...yes and no. Tracking is a process that will help you "get in  
touch with" and understand nature more completely. It can be more than  
that, though.

> The finite skills of survival are critical to living wild, but in this  
>day and age, and the environmental situation, respect for nature is at  
>the least, a viable subject. Unfortunately, it may not be a subject  
>that is politically correct to discuss.

To me knocking around in the woods without knowledge of where you are  
brings to mind images of a "bull in a china closet". In my opinion  
skills without an ethic is just another excuse to cut down trees, dig  
holes and kill animals. At this point in history, who needs it!

HOWEVER, that's my opinion. I understand it might not reflect  
everyone's. It may indeed not be appropriate to discuss here. I don't  
think we need to discuss it, for the same reason that we don't need to  
discuss it in conjunction with any other skill.

>

> I would gladly partake in any private discussion of this matter. BTW,  
> without our precious outdoors, most of these subjects would be moot!

That's all I need is one more on line discusssion,

Mark

Mark Z wrote:

>I believe that the "literal meaning" as understood by most people (i.e. >following a set of clear foot prints) is misleading and not very helpful

I have to disagree. I think it is MISLEADING to refer to tracking as ANYTHING other than its literal meaning.

>situations. For "novice survivalists" I would suggest learning this >skill as a first step. You may not understand why now, but I think you >may find that becoming a good tracker will strengthen, enhance and give

I use the term "novice survivalist" because I have never been to a survival school, nor do I teach those skills professionally. I feel that I have more knowledge and insight on the "non-physical" side. Throughout the year, I spend time in the timber, often just sitting for hours doing nothing...(hmm) but looking/smelling/listening. I have had some very powerful experiences during these times, but cannot for the life of me call that tracking.

Its difficult to explain, but I think everyone knows what is being talked about.

My CHALLENGE to everyone is to come up with an acceptable, and appropriate TERM for this! (all I can come up with is like.....groovin' man!)

Thanks for your time.

One would think so, but it is an "unmentionable topic" on the list for reasons that, although strange and obscure, seem to stand for now. He was one of my teachers as was he the teacher of many of the trackers listed on previous posts (i.e. Charles Worsham, Tom Hanratty, Jon Young, John Stokes, Jim Lowry etc.). I respect him, I just agree not to talk about him. That's all. If you want to discuss the issue further, contact me privately.

Max, I agree with you entirely. As someone who was not even aware that the term Tracking had another meaning as of one month ago, I found it quite confusing to make heads and tails of all this. I suspect that the term will also be quite confusing to anyone else which has not been introduced to the concept.

>

Again, I agree, I also have had very powerful experiences, but cannot for the life of me call that tracking.

> man!)

I believe that your challenge is a worthy one, and I would like to accept it. Here is my attempt at classification:

1. Steve Van Matre wrote several books related to the process of getting people to gradually "fit-in" to nature. He calls this process, and

titles his books:

#### Acclimatizing and acclimatization

These terms have been accepted in the outdoor education field and are being used by many other important researchers on these topics such as Jean-Claude Jay Rayon of QuÈbec.

2. Maurice Legault of Laval University (former outdoor pursuits professor) and many other psychologists like him are studying the effects of nature stays on personal growth, and lead trips into nature where the purpose of the trip is to develop self-awareness and gain other psychological benefits by the direct contact with the earth. Some of the experiences in this type of trip may seem "weird" to the outsider, but it is a valid field of study which is subject to much research. Like in any other field, the value of the experiences depend on the quality of the leaders and the before and after analysis of such. This domain of research is often called:

#### Eco-psychology

3. There are also many belief-based school of thoughts which view nature as Nature, and worship to various extents the miracles which happen when man encounters various powerful influences present in wilderness settings. Many of these schools of thoughts seem to be based at least in part on the study of native spirituality. This category of activity is usually referred to as:

#### Nature spirituality

4. The scientific term which is used to describe the study of the interrelationships between the various parts of natural systems is called:

#### Ecology

5. The study of physical phenomena which are encountered in wilderness settings and the subsequent attempt at trying to figure out what caused these phenomena is called:

#### Nature interpretation

6. The study of animal habits, behavior, reproduction, life cycles, dens etc. is part of the study of:

#### Animal biology

7. The study of theories and principles involved in becoming physically comfortable in the wilderness, and the learning of skills in various physical activities practiced in wilderness settings, refers to:

#### Outdoor pursuits and outdoor recreation

8. The study of teaching skills and group management skills particular to wilderness settings is called:

Outdoor leadership

9. The study of the use of the outdoors to teach course curriculum for standard school curriculums is called:

Outdoor education

10. The study of the impacts of outdoor-related activities, and resource-harvesting activities on the natural resources of an area is called:

Environmental education

11. The acts of defense of the environment against commercial development is called:

Environmental lobbying

9. The study of social and cultural aspects of primitive societies is called:

Ethnology

10. The specific study of physical survival skills used by primitive people is a branch of ethnology called:

Primitive technology

11. The study of skills and methods which can be used to prolong life while waiting for rescue in emergency situations is referred to as:

Wilderness survival

12. The study of physical signs which give clues to the movement patterns of animals is called:

Tracking

That's my feeble attempt at categorizing very complex and inter-related categories of study.

But, using these general definitions (in spite of their shortcomings), we can see that many schools of "tracking" are using that term loosely to include many of the above categories.

For the purposes of this list, still using the above general definitions, only the following categories (in my opinion) fall within the realm of our guidelines for topic discussion:

1. Primitive technology
2. Wilderness survival
3. Specific aspects of animal biology and tracking related to information which lead to improving trapping skills in primitive situations.
4. Specific aspects of environmental education related to particular primitive skills.

Thanks for reading this long post with little actual primitive skills content. I'm just trying to contribute to making group guidelines clearer. Remember, this is just my PERSONAL OPINION and you are welcome to disagree and orient the group discussions otherwise if you wish.

THANKS EVERYONE for your continued participation and great information sharing...

Hi Mark,

This will also be my final public post on this subject. Like you said, it will be more interesting to get back to the actual skills instead of discussion terminology.

Just wanted to say that I finally understood where you're coming from after reading the above paragraph. And I finally agree with you on this. My suggested definition of tracking was:

"The study of physical signs which give clues to the movement patterns of animals".

You are absolutely right in that there are far more clues out there than just tracks, scats, and branch nibbles. Obviously, all of the other factors you mention such as global and recent weather patterns, current bird and insect behavior, soil types, slope inclination, sunny spots vs shade and so on are all valuable tracking indicators. They are to be included in the "physical signs which give clues to the movement patterns of animals" and therefore fall in the tracking category.

It is easy to understand how advanced tracking, advanced nature interpretation, and advanced animal biology can overlap. It is the same in judo and karate- advanced judo has punches, while advanced karate has throws, and both have combat psychology. It's just a bit confusing to a beginner in martial arts.

Anyway, I hope this subject is now closed, if not, I will be glad to pursue it further off line.

Sorry for taking up group space on a non-skills issue. It has been interesting for me to observe myself be undisciplined and transgress my own suggestions for guidelines! Guilty!

Much tranquility wished upon everyone,

Andr -Fran ois

I'm going to take one last stab at this and then drop it as it seems to be going nowhere and I would rather talk about and practice tracking and skills then debate the terminology.

First of all, you may be right. This could very possibly be confusing to someone who is not a tracker. Tracking is an experiential process. These understandings come through the process of learning. However, every good tracking teacher will tell you that you focus on the tracks and sign to exclusion of everything else at your own peril. This is especially true when mantracking or in country where big, dangerous predators are (i.e. grizzlies or tigers). I have never had a deer circle back around on me and certainly haven't been stalked by a grizzly, but teachers of mine have and it happened because they were missing big pieces of the puzzle. At the very least the tracks fit into a context. They are not isolated, separate pieces. They relate to the place where they are. Being aware of that place, the rhythm of bird sound, the sun angle and time of day, past history of the area (primarily weather patterns) all fit into the story you are reading. In some instances they might be key factors. You can't age tracks, for instance, unless you are aware of weather patterns, the nature of the soil or ground cover you are tracking on etc. These are important factors. They are also not tangential to the process. They are part of the process.

Is this confusing. Probably. However, these are the primary things stressed by every teacher I have ever worked with in this area. My own experience bears this out. Keep in mind that these are people who are trying hard to raise tracking from a little understood side aspect of wildlife biology (the tracking I learned in school was so simplistic as to be useless) to an artform on par with, or maybe even surpassing the ancient practitioners. If you take a class with Charles Worsham or Tom Hanratty or a few others that have been mentioned here you will find a wealth of information that will both boggle your mind and open your eyes to the point where you have to say, "wow, where have I been all my life".

This is my last post to the group on this issue. If anyone wants to discuss it further, contact me by private email,

Mark Zanoni

I was once lost and had to spend the night out without gear because I tried to follow a stream back to camp and took a wrong embranchement where the Y in the stream had gone underground. To find my way back, after going up and down the creek for miles to find my camp which was on it's edge and never finding it, I finally decided to follow the creek IN the creek, and that's how I found out about my mistake.

PDF (Primitive Direction Finding) vice RDF (Radio Direction Finding),,,,

I guess my favorite uses radiation too! Poke a stick firmly in the ground, long or short I don't think matters, long may be more accurate. Mark the position of and measure it's shadow with another stick. It's a good idea to break the measuring stick at the shadow length point. Hang around a few hours until the shadow of the upright stick is the same length. Mark again.

If you're in the northern hemisphere, a line drawn from the upright stick and a point half way between the two marks (closest distance) is north. In the southern hemisphere, of course it's south and on the equator, you need more info. :) :)

It might be helpful to know what season it is in the tropics too. You could possibly be north of the equator and get a line that points south. If you're in the northern tropics, the sun will be north of you for some part of the year (by definition). Same problems in the southern tropics.

I don't know how to solve the tropic problem unless you have a handy whirlpool close, or know the season.

Speaking of seasons

Happy Holidayze All

Hi folks,

Dowsing was definitely not what I had in mind by primitive direction finding, but I don't mind the subject for now. In fact, many survival books claim that such things can work. I've seen finding water by

pendulum, witchhazel sticks, burying rocks, following spider web orientation, and all sorts of other weird unexplainable stuff.

Now, as a former semi-professional magician, I maintain that these things are all hocus pocus. My friend the Amazing Randi (Randall Swinge), who is Houdini's successor in magic circles, has offered \$100,000 to anyone who could demonstrate something weird in seance sessions that he couldn't explain (put the trick to light). He has never had to pay up in the last 10 years since he offered the prize.

I will offer the same \$100,000 to anyone who can find a jar of water buried in a field at random after multiple tries using any of the so called water finding methods. The common answer I get is that the jar interferes. Ok, let's put the water in earthenware crocks. Surely that is easier to find than water deep down through granite etc. It is obvious to my scientific mind that these techniques were invented by someone to take advantage of unsuspecting people and earn a living without working. It is absolutely incredible, don't forget, the length to which a magician can go to obtain information which will credit him with "superhuman" capabilities. Some people are absolute geniuses with hidden technology which will blow your mind with it's impossibility. Others are absolute psychological geniuses.

I think the explanation to dowsing on the browser page is accurate:

"As it turns out, the dowser may do nothing more than stimulate the users' own subconscious knowledge of where he or she lost the knife. Of course since we are usually looking for knives or other implements that we have lost, this may be sufficient, especially if it works more or less consistently."

In fact, the same amount of time spent actually searching for the knife in a methodical manner would have found the knife at least as quickly.

Searching for lost objects in survival situations can become very important if not life threatening. I remember visiting one student in a survival simulation groping around in the dark to find his whistle to call it quits. "I lost my matches in the snow" says he. I patiently talked to him, found out where he had been, and told him to start searching methodically in the most likely spot. After a few minutes, he found his matches and did not "die".

I teach that the trick in searching for lost objects is never to search in the same place twice. Do it right the first time. Go very methodically and precisely so you can eliminate sections of ground definitely. You will eventually find it this way, it's only a matter of time. If you don't look methodically, you can search forever.

Sorry about the flame, couldn't help myself, you hit a sensitive nerve.

It doesn't matter how many times people tell stories of "it worked", until someone can demonstrate that "it works" in a repetitive way, it is just blind luck.

Bury a knife somewhere at random in a sawdust pile 100 feet square, and you will never be able to find it repeatedly using dowsing, I guarantee that!

Just a stubborn scientist replying!

Following some streams here in QuÈbec would sometimes lead you to a 1000 mile trek without seing anythin until the artic ocean! Also, many places here are height of land where one creek flows into the atlantic and another to Hudson's Bay and another to the Artic. So I'm not so sure about the follow the creek method. Also, following creeks here usually means you have to walk in alder (Alnus spp) swamps which makes going very rough, especially on creeks that wind and wind and wind around bend after bend.

The sun and stars are indeed the safest orienteering methods.

Both subjects are interesting. However, I think you're opening up a very big can of worms, (we could write a whole book on the subject). Maybe more specific questions will help the rest of us answer.

How about the question of moss growing on the north side of trees, for instance. What do people think of that?

Best regards,

Andr -Fran ois

Hi Merv!

Chris here. I've had some experiences with dowsing. Seen our dowsing thread on Thrower (?), at:

<http://www.crl.com/~mjr/findit.html>

Could be flame bait & taboo subject: challenges the belief systems of some and perhaps not enough in others. Maybe it's been that way since Descartes and the dawn of the "Age of Reason" or some such - I dunno. I use it and sometimes it seems to work. No flames (please) list members. Sure it can be explained OR explained away, but a little voice in the back of my mind keeps saying, "There are more things under heaven and on earth than is in your philosophy, Horacio" . Dowsing's fascinating at least in a historical/contemporary context as a primitive practice that's survived to the present time.

Any dowsing experiences, Merv? Maybe a possible use for that Christmas tree after the big day, eh?

Chris

"Primitive" direction finding wasn't all that primitive. If you look into archeoastronomy, you'll find that pre-Conquest peoples in both North, South, and Central America had extremely accurate observatories all over the place. They clocked the movement of stars, planets, sun and moon, had buildings and whole communities arranged on lines to correspond with various orbits, holes in buildings where the sun shone thru only on the equinox, etc. The precision of their work often astounds modern day astronomers.

Since they had no magnetic compass, they didn't orient so much north/south/east/west as toward where the sun appeared at equinox and solstice.

Which reminds me -- today is the Winter Solstice.

Here in Virgina and in most every mid atlantic state, following the stream will  
always  
get you to someone's home. Everyone built along streams and there is no wilderness  
at  
all. :( Yes following the stream ban can be very difficult, but you don't have to  
follow the river, stream, creek, etc from the bank. This brings us to another short  
distance navigation method. Contouring. Follow a particular elevation on a terrain  
feature to a known point and move from there. Very useful in the dark when a compass  
is  
unavailable.

> The sun and stars are indeed the safest orienteering methods.

> >

Maybe the safest is the compass and good terrain & compass map orientation. I have been reading about use of various GPS (not very primitive to us) and the weaknesses for those unaccustomed to more primitive methods.

My answer is I don't believe a word of it. Sun, stars, landmarks (of limited utility), and terrain. Dead reckoning? Done some of that, too.

Say, is there much goo to eat among the alders?

It's fine, as long as you're in the Northern Hemisphere and not in the tropics and it's wet enough to have moss.

Barrel cactus tends to lean toward the south too. Again with the same caveats as the moss.

The Tahitians that first sailed to Hawaii used stars and wave motion.

You all get serious, I'm gonna have to do some reading. I've got a book in storage called "The Navigators" It's about the polynesian methods of

navigating. Some of the best pics of the stick and shell charts they used that I've found.

And I want to know how an astrolabe works! Can I build a crude one?

If it's like a sextant, you need time too, sundials anyone?

Andre, am I out of bounds yet?

Merv

Hi

Fascinating. figured I'd hit the religious side too, but haven't seen that...yet.

Chris, Andre, yes, I have had experience dowsing, both watching and doing. I can't say that it works all the time. Therefore Andre, i agree with the scientific side. I just have a problem explaining why it did work those times it worked for me.

My step father, who'd be grinning from ear to ear if he'd pulled a fast one on ya, says very seriously that he can dowse water with a bronze welding rod. I don't doubt him a bit. Personally, water has never really worked for me, but an underground wire especially with electricity running through it pulls the rods down very strongly. Just not every time. I don't know how to explain the times that work or what's different when it doesn't work.

And yes Andre, I have a very deep and abiding respect for the Great Randi! There's a lot of pure bull out there, just to make a buck. I like what he's doing.

The only explanation that I've read/heard that might have a possibility of being true is that the subconscious or unconcious mind really knows the answer that you're looking for and that dowsing is a way for it to communicate with you. So your own mind is whats controlling the stick, rod or pendulum your dowsing with. Nothing supernatural, just a method of communication.

Andre, for your "flame", a question, did Schroedinger's cat care? :) :) :)

Take Care All  
Merv

p.s. Andre, how's your back???

There is a great site for archaeoastronomy at:

<http://indy4.fal.cc.mn.us/~isk/stars/>

I also have reprints of an article written by Jim Miller on the  
so-called medicine wheel of the Mandan that has an excellent  
illustration showing its various alignments with constellations,  
villages and more for \$3.00, available from TRIBE. Just write the  
address below.

You're toying with us aren't you? I have seen moss growing on many sides of trees, very unreliable. More reliable plant signs are the growth of mature trees seems to grow thicker and toward the south. Long standing grasses may lay in the direction of prevailing winds. But all plant signs are not to be considered as reliable as sun and constellation signs.

>(this list is great keep it up men)

Three simple things I know of.....

First and most obvious is to look at the sky and clouds. No equipment needed but it helps to have some knowledge of cloud formations, etc.

Second, you can make a cheap barometer by stretching a very thin skin (bird crop maybe?) over a small container. Could use pottery for the vessel or maybe

a bark container that is sealed with hide glue or pine pitch to make it airtight.

(What you are after is something like a canning jar with a condom or balloon stretched over the mouth and tied in place. ) Glue a small piece of grass

in the center outside of the flexible \*drum\* (small stick, straw)

Place the assembly somewhere that it won't get bumped and rig up a fixed pointer

that is perpendicular to the grass needle and almost touching it. As the air pressure

rises and falls you can see the difference between the two pointers. Keep a log

of the relationship between the actual weather and your \*weather station\*

Third item for primitive meteorology could be a wind vane. Large turkey tail feather

would make a dandy vane, but some carving may be in order set up a good bearing

for the vane to rotate on. Another option would be to make a windsock out of that

thin material used on the barometer. Windsock would be my choice because it indicates both wind direction and velocity in one package.

We could resort to the \*weather rock\* that was used when I was a Boy Scout.

It was extremely accurate, but did not have much advanced prediction. Anyone remember those?

P.S. I think our own skin surface is a pretty good indicator of relative humidity.

Hope this helped.

> -----Fruit flies like a banana---

It sounds like a great subject to me. Pottery is not as hard to produce in a survival situation as many think. Although, it does require gathering usable clay (usually easier found than most realize), proper tempering (sand, burned shell; 25%), proper construction (Pottery being used for cooking must be more carefully formed than artsy pottery), it does take a 4-7 days at least of drying time before it can be fired,

proper pre-heating and at least two firings. I'd be glad to discuss this subject in more detail.

Because of the time needed pottery would definitely be a pursuit for a long term camp. Short term it is more practical to use other methods of cooking, which would also be a great subject for discussion. As far as boiling or cooking a stew, like you would use pottery for can be accomplished by hot rock cooking in a wooden container produced by burn & scrape methods or a rawhide container that is suspended over hot coals (It does drip though. If you hot rock cook in it it does not drip) or line a pit with a rawhide and hot rock cook in it (Make sure you use a fresh hide to do this, right off of the animal. This method also cooks any remaining flesh clinging to the hide into the stew, where it won't be wasted.)

Go for it Merv!

I suggest dividing the thread into smaller portions, for example:

Selecting clay  
Preparing clay  
Drying clay pots  
Making coil clay pots  
Making formend clay pots  
Firing pots in fire  
Firing pots underground

Etc.

Like I mentioned in my previous post on threads, let's try to keep subject headers matching content. The best way to do this is to discuss very specific topics.

Thank you, Merv, and don't hesitate to discuss. That's what we're here for!

Subject: Pottery Overview

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

X-Mozilla-Status: 0001

Since someone asked about producing pottery. I thought I might send out a few notes on the subject in parts over a period of time. I'll break them down in categories as Andre suggested so he can keep track of the threads for future reference. I thought I'd start with a general overview of a primitive pottery construction sequence. I have to credit Steve Watts with this nice organization of notes on this sequence. Steve is a good friend of mine and an excellent primitive skills instructor. Extremely knowledgeable. I consider him my mentor.

The sequence below is referenced in a primitive, anthropological matrix but is still very relevant to producing pottery in a survival situation. We are talking pottery for use as a cooking or eating vessel not as art. Pottery is great to cook in. It transfers heat very quickly to the contents of the pot and even allows you build up flame around a pot to cook in. Normally, flames are not used to cook with, coals are, due to flames' inconsistent temperature vs. coals consistent temperature. Cooking is another subject, but is definitely one we ought

to cover sometime in the future.

-----  
PRIMITIVE POTTERY CONSTRUCTION SEQUENCE

By Steve Watts (1989)

1. OBTAIN CLAY (Creek or river bank, bottom, etc.)
2. PROCESS  
If fresh, remove large rocks and organics, add water, if needed, wedge, knead, remove lumps. If dried, pound with mortar, reconstitute, let settle, let dry (if too wet), wedge, knead, remove lumps.
3. ADD TEMPER  
Sand, grit, shell, grog (broken pottery), etc. 1/5-1/3, knead, wedge.
4. VESSEL CONSTRUCTION  
Moulding, modeling, slabbing, coiling, welding, stretching/thinning, smoothing, malleting, etc.
5. SURFACE TREATMENTS  
Smoothing, stamping, burnishing, cord marking, brushing, cob impressing, punctating, incising etc.
6. INTERIOR TREATMENTS  
Smoothing, burnishing.
7. DRYING  
3-10 days, depending on conditions.
8. PRE-FIRING
9. FIRING
10. USE  
Cooking, storage, transportation, burial, processing, eating, etc.

I've read/heard that some kinds of pottery can be poisonous to use for  
cooking. Is there anything to this, and if so, how can you tell what you're  
using?

Fred

Pottery can be poisonous. Glazes can be poisonous. It depends on how you  
put it all together. You're not likely to find lead in the clay you gather  
because lead is a lot heavier than the constituents of the clay and would  
have sunk deeper in the soil.

Example, if you use a lead glaze you can get lead poisoning. Of course if  
you use gummite for glaze the pot will glow in the dark for easy finding  
too! (So will you as gummite is uranium, U235.)

Benjamin may have more on this, but I think that this is what you're  
referring to Fred.

Take Care and be sure your pots don't glow in the dark! :) :) :) :)  
Merv

I believe you hit the nail on the head---we had some pottery at one time that had been made in Mexico. As I recall, the pieces looked like they would make good bean pots, but somebody advised against using them for cooking. Also, I do remember that they had some glazed decorations on them. Thanks for jogging my memory.

The pottery I will be discussing does not use glazes. It is functional pottery that can be made from clay found and fired in a camp fire. I hope everyone saw my previous post, though that it is possible that there may be poisonous elements in the clay you gather. the only way to be 100% sure is to have it chemically analyzed. But neither I nor anyone I know has ever had any problems with this. I have cooked in pottery and also cooked squirrel, fowl and fish in sticky mud or clay and have never worried about it and have never got sick. I'm not downplaying the importance of this concern, just stating that I or no one I know has ever had any problems with it. To thine own self be true.

You bring out a good point. NEVER cook in a bought piece of pottery unless you have bought it from someone who has made it for utilitarian purposes, i.e. safe to cook in. Even buying pottery from the Catawba people who are one of the people that still practice the art of producing pottery in this primitive manner, should be questioned. For they produce their pottery in most cases to sell to the tourists who will not be using it to cook in. At very least, pottery improperly prepared for cooking purposes will not hold up under fire used in cooking. It is safest to make your own, if you are going to cook in it, however, if anyone wishes to purchase pottery I can recommend a source. I can also recommend a safe source of clay in Bethune, SC. He sells clean clay, ready to use for \$4.00 for 25 lbs. (Inquire about shipping costs). I have used it many times. It fires well and I have cooked in pottery made from it. Anyone interested in this clay can contact: Bethune Pottery, Rt. 2, Bethune, SC, Phone: (803) 334-8346.

Subject: Pottery--Acquiring Clay

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

Status: U

X-Mozilla-Status: 0001

When searching for clay you are looking for a type of soil that is plastic when moist. Look in places like stream banks, road cuts (sides of a hill exposed), even river bottoms. A good initial test for whether what you think is clay will have the elasticity needed is to roll out a long snake, then make it into a circle, pinch the circle closed, then hang it on your finger and bounce it gently. If it will doo all these things without falling apart, you probably have some good clay.

To clean the clay, add enough water till you have a slurry. Let it set for 20-30 seconds, allowing the heavier stones to settle. Then carefully pour off the thinner clay solution into another container (you may need to do this everal times). Then set the slurry aside for several days. The heavier clay will sink to the bottom and the liquid may be drained off.

Clay may be stored moist or dry. If you store it moist wrap it in plastic and store in a cool, dark, dry place. If you allow it to dry then you can store it and reconstitute as needed by crushing it up fine and adding water till you get the right consistency.

Hi Ben (and everyone else too),

I experimented for a whole summer with a research assistant with short  
term clay pots (trying to get from gathering clay to cooking in a pot  
within a couple of days). Very limited success.

Any thoughts anyone might have on this would be appreciated. Ben, how  
would you handle acquiring clay very quickly? Any ways you know of to  
speed up the process?

AndrÈ

This would definitely be a subject worth looking into. I personally have not tried and am not aware of ways to shorten time to the length of time you mentioned. The important thing for a successful firing is that all the moisture be dried out of the formed pot. Any moisture, the pot

explodes or falls apart. I suppose it depends on the humidity in your area as to how fast the pot dries. It is difficult to tell when all the interior moisture is out, that's why I give it plenty of time to dry, just to be sure. I will check with some more experienced potters and pose this question to them and pass on anything I find out. Meanwhile, if anyone on the list knows of a way to shorten drying time, let me know.

The other key factor in a successful firing is to take plenty of time pre-heating the pot. Move it in slowly, closer and closer, little by little to the fire. Also keep any wind from blowing directly onto it (build a suitable windbreak or dig a pit to fire it in.). Wind will cause a spall to pop off or the pot to crack. Get a good color change before you put it in the fire. BUT, I'M GETTING AHEAD OF MYSELF AND WILL COVER THIS SUBJECT IN DETAIL REAL SOON. Let me know if you have anymore specific questions or if you need the information on the complete process any sooner. I just thought I'd give it out little by little to organize the threads and to stimulate input from others.

Subject: brief intro and indigenous ceramics book  
Content-Type: text  
Status: U  
X-Mozilla-Status: 0001

This post will serve as a partial intro (more later as time permits) and a request.

I live in north-central Minnesota and conduct archaeological and paleoenvironmental research. Much of my time is spent on researching and replicating various technologies used by Native peoples of the region (primarily prior to European contact). My most significant speciality is indigenous ceramics. For the past 15 or so years, I have been researching and replicating these technologies. My goal has been to attempt to replicate the various technologies in as close a manner to that exhibited by the archaeological record as possible, using the same materials as would have been available.

In the process, I have made several hundred vessels of all sizes and styles, and have used many of them for cooking and processing. I can say that these ceramics are amazingly sturdy and functional.

Anyhow, enough of that for now. The Request:

An archaeologist colleague with a similar background in this ceramic technology and I are submitting a proposal to the Minnesota Historical Society (MHS) press to write a comprehensive book on the subject (there is no income involved for either of us - MHS Press is non-profit and mainly concerned with book sales covering costs). The question that they have is, is there sufficient interest in this subject to make this a viable project?

Both my colleague and I think there is and we really see the need to spread this information around, hence our desire to do the book. To our knowledge, there is little published info out, and based on our combined 30 years of detailed research, much of the existing information is misleading or inaccurate (for example, has anyone really tried to produce a ceramic vessel 40 centimeters in diameter with 3 to 4 millimeter thick walls out of glacial clays using a paddle and anvil? Believe me, you will only end up with a pile of clay.)

It would seem to me that folks in this group may have enough interest in the subject to comment on this proposal.

A brief and general contents of the book would include:

- General background of ceramics - types, characteristics, dates, etc.
- Materials (clays and temper) - procurment, processing, etc.
- Chapters on: Early coil built ceramics, Late Woodland fabric container supported ceramics, and Missippian shell tempered ceramics. Each of these chapters would have information on the archaeological evidence, vessel characteristics, research on the technology, detailed description of the technology, tools used including fabrics and weaving, and any other relevant data.
- Firing - methods, materials, temperatures (as measured by modern equipment)
- Use of vessels - cooking and processing, storage, durability, waterproofing,

etc.

The plan is to have it well illustrated with black and white photos and drawings. We would like to have enough technical content to be of use to the archaeological community, but also keep it understandable by the general public. You should be able to read it, and with a little practice, make good functional clay pots. Although the subject content will focus on the region that is now Minnesota, it will be applicable to much of eastern and central North America. The subject has absolutely no similarity to ceramics of southwestern US.

I would like to include comments of interest in the subject with our proposal. Thus, if you have an interest in the subject, or any other comments (hopefully positive) I would appreciate it if you could e-mail directly to me (please don't clutter up the list) at ggoltz@aol.com. I also would appreciate details of any other existing published information on the subject. Thanks in advance for any help, and I will keep the group posted on whether or not this thing flies.

I was always told not to use clay that I dig up for water or eating vessels because of a high lead content in the clay.

What part of the world is this where you have soil with a high lead content?  
It certainly is not the normal situation. If it is, don't eat the plants either.

This is kind of a repeat, but you probably wasn't around when I put this out, so...Most concerns of toxic material in earth dug clay is unfounded. The only way to be 100% sure if clay is safe is to have it analyzed. I, personally, have never worried about it and know plenty of other people who dig and make their own cooking vessels from clay and do not know of a single incident of toxicity in the clay. However, don't just go on my experience, always, to thine own self be true. If you would like some excellent clay that you can buy that I know is safe,

because I've bought a lot from this guy and made cooking vessels from it and used them, write: Bethune Pottery, Rt. 2, Bethune, SC, Phone: (803) 334-8346. He sells it for \$4 for 25 pounds, You'll have to discuss with him, though, about shipping costs.

Finding versus buying clay:

The area I live in has soil with an incredibly high clay content. I planted a tree in my backyard and dug through 3' of the toughest digging you can imagine. Then I looked at the clay, and gave it the 'turd' test. I wet it and rolled it into a long turd. It didn't break when I held it by one end. I decided what the heck. I gathered some, screened out the bigger chunks, ground it all down on a matate, and added sand

for tempering (I've heard 50% to be the right amount, but I found it too much sand, about 1 part sand, 3 clay worked best. I mixed it with water to a good consistency and shaped it using hands wet with water. I made a couple of functional pots using the coil method. I fired them in the next campfire and was quite pleased with the results. I tried to replicate this on a survival trip. Every pot broke in the firing. Lesson: the pottery gods were angry? My guess is that the drying process was insufficient, and the moisture was too high in the clay when I fired it. Anyone else have any ideas?

Thanks  
Kevin

up over the pottery, let it almost die down then build the fire up again. Then, let it cool down just as slow. If convenient fish it out of the ashes the next morning. Cautions: Don't let wind hit the pot prefiring or cooling down. Don't let flame touch the pot while prefiring.<

Great tips! Thanks Ben. I think I took them out of the fire in too much of a hurry, and there was a bit of a breeze. Actually, in my haste I took out one of the plates, set it on the ground, reached in with the tongs and grabbed a bowl and as I was lifting it out, dropped it on the plate and broke them both! Cheez! did I feel like an idiot. Everything I made in that batch either broke or exploded except a spoon. Live and learn. Preheating makes great sense in a situation like my first pot where it rained the whole week leading up to the firing. Thanks.  
Kevin

Continuing the pottery thread, I began. It is good to see that we recently had someone recently join the group with, what sounds like,

quite a bit of knowledge in this area. I look forward to their input and anyone else's.

I last discussed choosing and preparing clay. I don't know remember if I mentioned in that last thread that if you buy clay for making functional pottery for cooking in, etc. be sure to by earthenware clay not stoneware clay. The reason being that stoneware clay needs a higher temperature to fire than a campfire can produce (there may be ways to up the temperature artificially in the wild. I'd have to look into that one.) Anyway, your average open fire is at 1300 degrees Farenheit, at best and very variable. Stoneware needs 1500-2000 degrees Farenheit.

I joined too recently to see any of the earlier pottery stuff, so please excuse me if I repeat info already covered by someone else. I will try to do a series of posts on various aspects of the subject. This first will be finding and procuring clay. I will confine all discussion to non commercial sources of materials. If any of this gets too lengthy, give a yell.

For starters, what do we really mean by clay? This depends on your perspective, be it geologist, engineer, farmer, construction contractor, or potter. My original college training, and much of my "real Job" career was as a soil scientist, so I will draw on that background to relate to the stuff we are interested in for pottery.

Technically, "clay" is a soil particle less than 2 microns (.002 mm) in diameter. The soil texture type (different use of the term than soil particle) called "clay" is material that contains generally more than 40 or 50 % clay sized particles (depending on the % of sand and silt sized particles).

What we need for pottery is neither of these. The best natural clays for the type of pottery we are dealing with contain from 30 to 40 % clay sized particles, with the remainder hopefully being half or more sand sized particles (a dominance of silt creates a rubbery or "cheesey" material which doesn't hold together). In soil science terms, these would be called "sandy clay", "sandy clay loam", or "clay loam".

Now this may sound like useless technical information, but I include it for good reason - to help you locate clay sources (at least in the US). Much of the US is covered by soil survey reports done by the USDA Natural Resource Conservation Service (formerly Soil Conservation Service). These reports are available on a county basis - check libraries, or look in the yellow pages

for Agricultural Extension Service to track these down. The reports will have maps of soil types and descriptions of the soils. Look for soils with the texture terms I mentioned. If you read the descriptions, you will get info on how deep below the surface the good layers are and about how thick.

IMPORTANT NOTE: don't just go by the name READ THE DESCRIPTION. Something may have a name such as "Chester sandy loam", but the description may show a sandy clay loam layer deeper in the soil.

Surface soils are rarely useable, but good exposures, either natural or the more common roadcuts should be easy to find and will allow a quick examination of the soil.

Finer textured soils including "silty clay loam", "silty clay", or "clay" are useable, they just require more temper (more on this next time) added to make them useable. Coarser soils such as "loam", "silt loam", "sandy loam", or "silt" are not useable.

OK, what if you don't have access to soil survey information? In the US, you may still be able to get enough information from a county extension agent.

Just explain what you are looking for - use the soil texture terms mentioned above. Otherwise, use the following tips:

-In non-arid regions, look for areas with medium to fine textured (not sandy) geologic deposits. The process of soil formation will have removed clay particles from surface layers and caused them to accumulate deeper in the soil, resulting in a zone of clay enrichment usually beginning 1 to 3 feet below the surface. This is what you are looking for. It is frequently darker and brighter colored than the layers above or below. It is usually not too thick (a foot or two is common). If you have geologic deposits that are naturally fine textured, you probably don't need to worry about soil formation.

-In arid regions, naturally occurring geologic deposits can usually be found that are useable. Soil formation will not have done the concentration for you.

-To test the material, moisten it to a workable consistency (spit on it) and roll into a coil about 1/8" in diameter with your fingers (make sure it is not too dry). If it stays together, slowly bend it into a "U" shape. If it bends without breaking or only cracks a bit (still stays in one piece) you have OK stuff. If it slightly cracks, it may be useable as is. If it doesn't crack at all and seems very plastic and workable, you will need to add some kind of temper.

With a bit of research and poking around, useable clay can usually be found in most areas. The nature and quality will vary from region to region, and probably accounts for some of the differences in technology, vessel style, and amount of pottery used by native peoples. A prime example of this is the contrast between SW U.S. pottery and that of the eastern woodlands.

While it is certainly interesting to read how to find clay and make pots,  
under a survival conditions, who has the time?

Isn't this why so often game was coated in wet clay(or mud) and then toss  
onto the open fire?

Here at home, we have from-the-store clay pots we can soak in water and  
then cook in. Or take a brown grocery sack, oil it and bake a bird, fish  
ect.

But in the bush, pots making skill would be handy, if you were stuck in  
the same spot for a longer time. Othewise...muddy the meat and cook it:)

Most likely. Any trace of moisture will make them go off like popping popcorn. You cannot air dry all of the moisture out. The preheating is absolutely needed to drive out the chemically bound water. If you preheat well and still have the problem, your clay may not be tempered enough. You need to get the clay content down to around 35 percent, 40 at most. If you start with some real sticky stuff, that may be 75 % or so, you almost have to mix it half and half. As long as you can get it to stay together enough to form and dry, it will fire OK. Another common problem is having the vessel too thick. It then becomes very difficult to drive all of the moisture out by preheating.

If you still have problems after these tips, let me know.

I agree. When I started this thread I made that point exactly to the person who asked about it. Pottery is definitely for a long term camp. There are many methods of cooking without a container. I could tell you of many I have experienced. Oh, by the way, don't use pottery at home for cooking. Most is not made to stand up to the temperatures of cooking. Some also have poisonous glazes. Even pottery bought from the few Native American peoples that still sell it should be questioned for most of them make it for the tourists for sitting on a shelf.

To eat meat you don't need pots. You can put anything from a frog to a moose on a spit and eat it off the fire. Two things happen with pots, which would make me want to make a pot first off for survival: One, you can utilize all kinds of vegetation which would be marginally useful or not at all useful in the raw state (remember how many hours gorillas take to fulfill their fuel requirements on raw vegetation??). This makes it possible to expand the nutrition universe by at least 300 or more percent. You can include all kinds of leafy and root crops which would be only marginally eatable, or inedible, raw. Most hunter-gatherers depend about 80% on the vegetation which women gather and only a small percent on the meat which men get (this is reality, not some dream world). Meat protein contains all the amino acids which one needs plus fat, which is lacking in vegetation, so it is highly prized in non-western diets. However, you certainly can, and can more easily, live on vegetation---particularly if you cook it and thus make it more digestible to the human system.

Second, only long cooking, particularly in the presence of acid, will leach calcium from bones. You can't get the max effect of calcium by only eating barbeque. This might not be a problem for males, but if you define survival to include not just yourself, but for the perpetuation of us all, especially for more than a few days, calcium is a must. Women who are pregnant need it, infants being weaned need it, old women who are the wisdom of the tribe need it. Cooking in pots provides it.

Now, if you are in a contrived "survival" situation where you are seeing if you can "make it" for a week, the reality is that you probably don't even need to concern yourself with food, except for your own creature comforts.

Your primary concern is to replace bodily fluids. In a real situation where you have no idea how long you may have to subsist, I would want to have as many potential long term skills in my bag of tricks as possible. The ability to manufacture such a useful item as ceramic pots sure beats cooking in a rusty tin can. And, BTW, you can even boil your water in a clay pot to sterilize it. Sure beats iodine.

HOLD EVERYTHING, THIS IS CRAZY.

Pottery made following the technology of indigenous North American cultures from natural clays is perfectly useable and safe to use. First of all, there are no glazes. If you make it yourself, you know that, and if you are using tourist trinkets, you are probably on the wrong list.

Second, if properly made, it will stand up to most anything. I have a pot that I have been cooking in since 1988. I have made plaster molds from the pot for casting replicas. It has spent at least two winters outside (have you ever experienced a northern Minnesota winter?). It has been loaned out for lectures, knocked about in trunks of cars, and subjected to more abuse than I can recount. It is as good as new. I have another pot that accidentally spent a winter outside, right side up with leftover food in it. I discovered it in the Spring melting out of a snowbank and filled to the top with ice. That was the Spring of 1993. I still cook in that pot.

Properly made and fired pots from natural clays can be used on a gas kitchen

stove with every bit of confidence that you can give to Corning ware.

Let me recount a bit more of my own experience with these remarkable items.

my first cooking attempts with this pottery were done very gently. The literature is filled with references to such things as thermal shock, fragility, and the like. it is often stated that pottery was probably not transported because it would break, and a whole lot of other nonsense. All of this is based on theoretical stuff generated by mostly middle class urban folks - the kind of people that typically go into archaeological research.

Now, don't get me wrong. I would be the last to criticize the archaeological profession, after all, I am a member of that community. But the fact is that a lot of long standing myths have been perpetuated simply because almost nobody has done the hands-on research to find the real answers.

As I was saying, I started out very gently with my pots. I started each cooking with cool water and built up the fire gradually. Over time, I got braver, since the pots were suffering no ill effects. I finally "let it all hang out" one day, and fried some meat in a pot, got it good and sizzling brown over a hot fire. Next, I added a handful of onions, and after a bit, dumped in a quart of cold water. No problem! BTW that was 1989 and it was the pot mentioned above that I made in 1988.

On another occasion, I was asked to produce a pot for a museum display in Saskatchewan. The kicker was that they wanted it to look like it had been excavated as pieces and glued back together. No problem, I thought, just will cost a bit more than a good one. When the firing fire burned down, I removed the pot hot, hoping for some good dunting cracks (cracks from the rim caused by rapid differential cooling). I got one short one. After cooking up a good mess of fat, water and other nice things in it to "age" it, I set about to break it into pieces, inserting a screwdriver into the crack and twisting it sideways. The crack opened 1/4", but got no longer. Only when I used two screwdrivers and "leapfrogged" my way down the crack, was I able to finally break the pot into two pieces. I could have probably used that cracked pot for years with no problem. The crack had sealed after about 15 minutes of cooking, being clogged by burned food residue.

The point of this long discourse is simply to point out the myths surrounding the indigenous Woodland ceramic ceramics of North America. This, perhaps points out the even greater need to pass along this information, since nobody seems to have much factual knowledge.

As I said earlier, for other than a short term "boy scout" adventure a good ceramic pot would be one of my first survival priorities. One squirrel can make a BIG pot of stew, and it's kind of nice to be able to sit around and watch the pot boil, rather than scrounging for the next rabbit. One might also take a lesson from the archaeological record. The leavings of Paleo and Archaic hunters are pretty slim in most areas. With the advent of pottery in the Woodland period, populations began a rapid increase. Perhaps the feeding of hungry mouths became a much easier task.

Hope I haven't offended any body, that is definitely not my intent.

Grant,

While I agree that pottery added to the lives of Paleo tribes, I believe that you are reading too much into the "archeological record". The fact is that paleo tribes had baskets some sealed with pine pitch that was used for cooking, and even if they didn't as seen by their use by Plains and other Indian tribes in the historical record, an animal stomach or skin pouch can be used for cooking by setting it up on a tripod filling it with water and food, and then dropping heated rocks into it. Most of these items do not survive as well as pottery over time, but that doesn't mean that non pottery users suffered from the lack of pots. Other than that great post

Subject: Pottery--Tempering

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

Status: U

X-Mozilla-Status: 0001

Temper is the introduction of foreign matter to the clay for the purpose of stopping microscopic cracks from continuing into bigger cracks. Have you ever drilled a hole in your car windshield to stop a crack from growing bigger? Temper is introduced in clay before forming a pot for that purpose, for when pottery is fired the entire pot is expanding and contracting and is under some incredible forces.

What is used for temper? Good choices are fine sand, crushed stone, burned shell, old broken pottery (called grog) and plant material (The earliest pottery temper in North America was Spanish Moss. Plant material is the least best of the tempers named.). Broken pottery cannot, incidentally, be recrushed and reconstituted for clay because it is no longer clay, it is vitrified. Fine material is best, but not too fine. For example, don't use real fine beach sand, use sand that has larger particles, but pick out any really big pieces.

Temper should be added to the clay, approximately, as follows: 1/5 to

1/4 temper to clay or 1 to 3. Now, I'm going to give you a real scientific way to measure out the temper, that Steve Watts gave to us that has worked consistently for me. Knead and roll out clay into a pizza about half inch thick, sprinkle with good quartz sand, pick out the big pieces (It should be well covered but only as much as will cling to the clay, not a thick layer of sand.), now roll it up and pinch the ends shut into a burrito, now squeeze and knead until well mixed throughout. I hope my unscientific approach doesn't offend anyone, if anyone wishes to give a more scientific explanation for the more scholarly among us, please do so. I, personally, like explanations that don't require a measuring stick or measuring cup. I hope some of you do. I just don't carry such measuring devices in my survival kit. I use a similar approach when I am making primitive weaponry for someone, for example, the length of their arm or their height in relation to the weapon being used.

You can temper as much clay as you wish to use or keep a bag marked as tempered clay for storage, if you need to store a quantity of it. Under ideal conditions, like at home, keep your tempered clay same as your fresh clay.

What it probably said was more along along the lines of there was the beginning of a major population increase. The reason was that pottery greatly expanded the easily available food base, primarily because it made processing things like starchy vegetables and seeds and nut oils quite simple. Thus, it allowed a major cultural revolution, if you will, in the subsistence structure, making it much easier to feed more people. In short, food became less of a limiting factor in population size.

Certainly, stone boiling in bark, hide, or other containers was probably practiced, but comparing that to the ease and flexibility of cooking in ceramic pots is like comparing night to day. Try making maple or birch syrup by stone boiling, for example - yech! what a mess.

In a message dated 97-01-11 10:25:04 EST, you write:

<< I think I met your colleague years ago on a sabbatical leave. He was making upside down pots out of coils in a parabolic shape. Am I right on this? What's his name?

To answer your request: I think there is a major need for information on making and firing pots out of native clay and especially on how to fire them outdoors without modern means. Very little on that as far as I know, but tons on modern stuff.

I have experimented for a whole summer trying to get FAST clay pots made (within a day or two). Very limited success. I'm sure any information you could post on this subject would be very very appreciated.

>>

Andre,

Thanks for the reply. You have obviously met my colleague, Michael Budak. He manages the Grand Mound historic site for MHS. Besides ceramics and a whole range of other experimental archaeology skills and teaching, he is an avid atlatl thrower.

I will try to put together a series of short posts (don't want to overload the system) on ceramic technology to do over the next few weeks (or months) if you think such a thing is of enough interest and appropriate.

I remember well my first attempt at primitive (I really don't like that term, since the technology is far from that) pottery, in fact I still have the fired pieces in a bag somewhere in my lab! (yes, pieces, it completely exploded) The main trick is to not use too sticky of a clay (helps to add sand or other temper) and be sure that the vessel is COMPLETELY DRY. Warming it for a half hour or so by the fire before tossing it in is a good idea.

Once in the fire, I cover it (them) with a layer of small wood and let it rip. Firing is usually done in about a half hour.

While I'm here, just a few more bits of info. I do have a web page (currently terribly outdated - will be updating in a few weeks and will include a gallery of western Great Lakes ceramics) at <http://members.aol.com/ggoltz/index.htm> if you care to check out a bit of what I am into. We (archaeologist, Dr. Christy A. H. Caine; Ojibwe Elder, Sharon McKenna; and I) also teach an archaeological field school for Hamline University each summer. It is unique in that we teach two courses, one of

which is actual archaeological field methods -three days a week, and the other, Ojibwe culture -two days a week. The students learn a wide range of traditional skills and teachings which put the archaeology into a perspective that few students get exposed to. You can find a bit of last year's info on this at <http://members.aol.com/nminn/index.htm>. Again, this will soon be updated.

I will try to gradually post some of this for the interest of the group. In the meantime, feel free to pass on the web site info if you think anyone might be interested (not trying to promote myself, just make info available).

Thanks for organizing this group, and am looking forward to shareing as much information as possible with the members.

Grant

Anyone who hasn't checked out Wilderness Way magazine might want to. My friend Steve Hulsey has a real nice site and Wilderness Way has some really great information. This one of the magazines I write for and I hihighly recommend it. H e also publishes Primitive Archer magazine. There is an article at this site on direction finding, pretty basic, but good, although I'm not too sure about his referencce about moss growing on the side of a tre nearest the equator. I really like the worm calling article there, though. I'm going to have to try this. A way of bringing worms to the surface of the soil by vibration. Anyway check it out:  
<http://www.pioneerpc.com/wildernessway/>

Subject: The History and Primitive Technology Page

Content-Type: text/plain; charset="us-ascii"

X-Mozilla-Status: 0001

Hello,

To those that do not know about this page, please give it a look see. I think you will like it. This is the place to explore, discuss, and exchange information on matters pertaining to history from the stone-age to the turn of the century. It is also intended to be a place where you can find information on various primitive technologies such as ancient methods of firemaking, flintknapping, and what is often referred to as "buckskinning" crafts. This is a great site. Here is the URL  
<http://www.geocities.com/CollegePark/4201/index.html>

Merry Christmas

Hi, I'm Wanita Sears. Found out about this group from the knapper list.  
Sorry for the semi intro. It's hard to pin down my hubby, Joel for the  
computer other than to look at the messages. He is a knapper and spent much  
of his boyhood in the woods learning survival skills. The medicinal plant  
threads interest me on this list.

Haven't been able to contribute much due to working on our home page the  
last few weeks. I will include it in our signature. The messageboard is not  
quite operable yet. I have Tara's permission to link to Native Tech at  
Uconn. That link is on the stone tool page but if you would rather go right  
there the URL is.

<http://www.lib.uconn.edu/ArchNet/Topical/Ethno/NativeTech/NativeTech.html>

Best wishes in '97,  
Joel & Wanita Sears

Sorry Andre, I didn't tape it, but the bottom line to the programs is the fact that these forest dwelling cultures alive today are probably the last generation to live in this manner in this area. Forest cutting, mining (contamination of the water by mercury), and agribusiness (cattle and fariming) are about to swipe the viable forest from the face of the earth.

I would say that survivalist in the future will have a very difficult time at best what with the competition for the diminishing wildlife, plants, and water.

As Tom Brown Jr. suggests in his on line interview (AOL - sorry I don't have the date), the survivalist of the future will have to seek out the most inhospitable terrain he can find in order to avoid the onslaught of food seekers.

Sorry about the air of doom, but I can see it coming.

I agree up to a point, You will still have only a small percentage of people catching and making full use of the resources at hand. It will be those that are willing to learn the old methods and keep them alive that will teach those that will survive. So called primitive methods work because their ancestors learned and proved their methods in the laboratory of nature. Failed experiments didn't survive into the next generation.

> The most inhospitable terrain will be your back yard. Most metropolitan areas have  
a three day supply of food available for sale. When the electricity goes, you have  
the supplies in  
your kitchen and the gasoline in your car (250 - 400 miles or less in traffic, lots  
to  
traffic). That wont get most of us out of harm's way and everything we take for  
granted wont  
be accessible without electricity to pump it, prepare it, store it, etc. If you  
survive the  
48 hours, then your primitive skills need to make the most of what is available to  
you - your  
own backyard.

Hello Primitive Skills people (including my favorite Botanist's Christopher and Delores Nyerges),

Along that Ethnobotany thread (thanks for starting that thread, BTW), I started searching Ted Bailey's spiraling website links (Thanks Ted!) and was delighted to "find" a place that I hadn't traveled to before:

The Ethnobotany CafÈ

<http://countrylife.net/ethnobotany/>

You can search for the scientific names of commonly known plants, check Native American food and medicinal plants, post e-mail specific plant queries and arrange sale or trade of flora...and much more. Looks like a pleasant place to visit and have a Mesquite cappuccino. I could almost smell bread baking in the kitchen. Please check it out.

Merry Christmas Eve,

Chris Smith

AndrÈ and Jim Burdine and others,

Enjoyed your discussion on Indian plant toxicology. Don't know if any of these could be put on blowgun darts or placed in a watercourse for

fishing, but this should really help your research. I believe you asked for the scientific terms for common plant names Andr e, and Jim you may be researching Cherokee poisons. This seems to accomplish both.

Searching the Native American medicinal plant database at the Ethnobotany Caf e website, I found a page listing Amerindian plants, used for their poisonous qualities, apparently. They are listed by tribe and are well cross-referenced. They're listed by their scientific names and tribal users. Click on any one of them and common names, referenced reading and a description presents itself.

Indian plant poisons  
<http://probe.nal.usda.gov:8300/cgi-bin/webace>

Even more interesting to me was the full database (Related Links page) of 80,000 world plants used for food and medication (including antidotes for plant poisons).

<http://countrylife.net/ethnobotany/>

The database Search Engine was unfamiliar to me and had far more features than my VCR, but I was delighted to see that (with some fumbling and mumbling), I could do useful work. There is a help link.

I enjoyed my time in this enormous database - hope this helps.

Merry Christmas,

Chris Smith

In a message dated 96-12-30 20:49:37 EST, tbailey writes:

<< Richard Burrill in Sacramento, California sells a book about ISHI. He sent me a copy in exchange for a boomerang last Fall. He has a WWW page that has videotapes about ISHI for sale. I didn't see the book for sale on the web page, but you can send Richard email inquiries at: RBurrill@WorldTouch.com or visit his WWW page at:  
<http://worldtouch.com/Anthro/supplements.html> >>

Thanks for the scoop. I think I recall the book ISHI (posted previously by others) had a picture of him working a hand drill. If the films show that also, it would be a big help to anyone wanting to learn the technique. One of the things that helped me after a couple of years of failed attempts was watching a quick spot on aboriginal Africans working a hand spindle on a special hosted by (I think) Charles Curalt.

Matthew Rapaport's Thrower website has an extensive book and video page on  
throwing and slinging things. The ISBN-address-review are listed (and pasted  
below for you) but the price and shipping costs aren't there. Check the website  
page for the full list of titles. This should help:

<http://www.crl.com/~mjr/books.html>

Knife Throwing for Sport, Survival, and Self Defense  
Blackie Collins  
Pub. (?) Knife World Publications. Box 3395, Knoxville, TN 37927  
ISBN 0-940362-03-1

Very small book. OK for beginner maybe, but does not illustrate enough styles,  
only one.

Here are some more knapping sites if anyone is interested. This first one is not quite finished, but the guy knapped with Crabtree, so he must have some pretty good knowledge on the subject. Once it is finished, it may prove helpful to many on the list.

<http://www.ucalgary.ca/~dthanna/flintknap.html>

<http://www.lib.uconn.edu/NativeTech/stone/index.html>

Also, concerning posts that inquire about knap-ins, Whittaker's book has a long list in the back of what appears to be yearly knap-ins across the country. If anyone is interested that doesn't have the book, I'll post them (just as soon as I complete my FINAL for my archaeology theory class). Let me know if you are interested.

Nothing runs contrary to nature,  
Only to what we KNOW of nature.

Bonjour,

Voilý quelques rÈfÈrences ý des revues de technologie primitive :

PRIMITIVE ARCHER

P.O. Box 209

Lufkin, TX 75902-0209

1 year (4 issues) Canada is US\$24

Je suis disposÈ ý t'envoyer les copies des articles qui seraient susceptibles de t'intÈresser, puisque je

dispose des 15 numÈros anciens (je peux t'envoyer la liste des articles)

BULLETIN OF PRIMITIVE TECHNOLOGY

P.O. Box 905

Rexburg, ID 83440

1 year (2 issues) Canada is US\$20

C'est un must (que tu dois connaÔtre certainement).

Je dispose Ègalement de tout les anciens numÈros (et je peux envoyer la liste des articles)

WILDERNESS WAY

P.O. Box 203

Lufkin, TX 75902-0203

1 year (4 issues) Canada is US\$ 39

Encore une fois, je peux t'envoyer sur simple demande la liste des articles, puisque je dispose de

l'entiÈretÈ des numÈros.

PRAIRIE WOLF

John and Gery MCPHERSON

P.O. Box 96

Randolph, KANSAS 66554

TrÈs belle sÈrie de petites publications sur les thÈmes de la cuisine primitive, du feu et des cordages

primitifs, du tannage des peaux primitif, des rÈcipients primitifs, arcs et flÈches primitifs,

propulseurs primitifs, chasse au cerf...

Je dispose de l'entiÈretÈ des publications, je peux donc te faire parvenir la copie des fascicules dognes

d'intÈrít.

Autre ressource trÈs intÈressante,

TRIBE

P.O. Box 20015

Charlotte, NC 28202

Phone (704) 827-0723

Tribe vend une superbe sÈrie de planches didactiques au sujet de :

Bark covered shelter  
Burn and scrape bowl  
Emergency firemaking kit  
Building a debris shelter  
Twisting two-ply cordage  
Primitive fishing rigs and spears  
Simple survival bow and arrow  
Chippewa kitchen  
Handy fire starters  
Stone tools  
Tools for drilling  
Bone awls  
Primitive/Survival knives  
Making and hafting a stone axe  
Making and using an atlatl  
etc ...

J'ai re u une publicit , mais je ne dispose pas encore de l'enti ret  de leurs fiches et de leurs publications.

FIELD GUIDE TO PRIMITIVE LIVING SKILLS (3rd edition)  
de Thomas J. Elpel's  
 dit  par Hollowtop Outdoor Primitive School  
Box 691  
Pony, MT 59747-0691

Et  galement NORTHERN BUSH CRAFT, de Mors L. Kochanski  
Chez Lone Pine Publishing (Canada ?)

A titre personnel, je dispose d'une bonne bibliographie au sujet des modes pr historiques et ethnographiques de production du feu, et je peux t'envoyer des copies des kits de feu Marcassite/Silex/Amadou qui sont attest s en Belgique depuis 14.000 BP.

Surtout, il ne faut pas h siter   me demander une copie des articles int ressants. Je sais que l'abonnement   ces revues co te tr s cher. J'ai toujours privil gi  les  changes d'informations, qui sont bien plus constructifs quand on correspond avec des passionn s.

A bient t sur le NET.

I recently returned from an interesting research event that I thought I'd tell everyone about. Scott Jones teaches primitive skills at his school, Hofunee Programs in Athens, GA. His school is registered as a research site. He recently held an event to study the impact fracture of points made in the Archaic Stemmed Point tradition and document manufacturing failures. Participants had to make and haft several stemmed Archaic (Savannah River) points each into a foreshaft, make an atlatl dart on site and then cast at various targets until the point broke. Stone materials used had to be material other than obsidian, preferably quartz, cherts and some novaculite, material similar to the material found used in these type points.

The point was traced on a bag before hafting then the broken pieces were collected and it was recorded on each bag how many times it was thrown, what target it was broke on, as well as who the knapper/thrower was. Targets included a deer carcass (raunchy..whew!), several large rocks and a wooden stump.

There were some really nice breaks! We all had a great time. Who would have thought making a point and then watching it blow to bits on a target could be such fun. But, beyond having fun, this was an event with a purpose that I think will bear out some valuable information when all the results are studied, logged and evaluated. Events like this give us all better understanding when we find those broken points archaeologically. Events like this are also valuable in bridging the gap between primitive technologist and archaeologist. I for one hope to see other events like this one with similar goals.

I'm not sure when Scott will be publishing his results, but I'll pass it on how to acquire his report when it is available. If anyone is interested in Scott Jones' reasearch and other classes he holds, write him or give him a call at: Hofunee Programs, P.O. Box 2446, Athens, GA 30612, Phone: (706) 743-5144. Tell him Benjamin Pressley from TRIBE told you about him. ---Benjamin (benjamin@perigee.net)

Hi All!

I just ran across the Three Rivers Archery web page at:

<http://www.3riversarchery.com/index.htm>

Its a pretty cool page and they have some really neat knapping stuff. I'm getting a few friends to go in on a big order and was just wondering if anybody on the list had done business with them. Also, does anyone happen to know about laws about importing animal parts (antler & sinew). I'm in Canada, eh?

Tim

For those of you into IRC chats, there is a Tracker channel on the Undernet called #Trackers. I haven't been on yet but plan to soon. I'm told there is usually always someone there to chat with about Tracking & Tom Brown Jr.

Is there something similar for this group? Like #Primitive??

Howdy,

I just wanted you all to know that Benjamin has an incredible article in the January, February issue of the Backwoodsman Magazine. He covers primitive weapons in a way that would answer most of the questions we've been discussing recently. His illustrations are excellent and very descriptive. If you don't know where to get Backwoodsman you can call and talk to Lynne Richie at 719 783 9028 and get a copy. I know they are out of town for a couple of weeks (getting out of the Colorado snows!) but they'll be back.

Mention my name(if it dosen't pain you too much :>)) or Benjamin's as they're friends of ours.

Happy reading!

and Way to go Benjamin!

Rob, I'd be glad to tell you little bit about the Rabbitstick Rendezvous.  
It's held held near Rexburg, Idaho every September. The site is on  
private land and is just beautiful. At night you can hear the owls hoot  
and the elk bugle. Last fall, on the 1st day, everything came to a  
standstill while we watched a flock of about 30 or so pelicans cruise the  
river in search of lunch.

Some of the best primitive skills instructors and practitioners in North  
America come to share their expertise. The best thing about it is that  
it is short on lecture and long on hands-on and practical experience.  
The only problem is that there simply is not enough time to do everything  
that you want to do. It forces you to select the projects that are most  
important to you at the time and follow 'em through.

The first day the instructors do their "advertising" of their classes so  
that you can select your "course of study." The schedule is posted on  
the bulletin board so that you can refer to it at any time.

A partial list of subjects has been: Rabbitsticks (of course), brain  
tanning (both primitive and modern methods), plant identification & uses,  
self bows, atlatls, finger & card weaving, felting, knapping (flint &  
obsidian), drum making, twining & net making, tule reed boats, making  
moccasins, medicine/peace pipes, making and firing pottery, spoon carving  
and the list goes on and on. The important thing is to pace yourself so

you don't try to do too much in too short of time.

When the week is over, you have new tools/toys (is toys a forbidden term?), great experiences, and best of all, new friends!

As far as accommodations go, you have a number of options. You can bring your tarp, tent, tipi, or tin tipi (camper) and camp out or you can stay in town at a motel. It's wise to be prepared for ALL types of weather. Last fall it rained the first three days, but that didn't dampen or slow down a thing. Everyone came pretty much prepared.

There is a community breakfast and dinner each day. Volunteers help the staff prepare and clean up. After dinner there's a drawing for stuff that the instructors have donated. At night there's a campfire, drumming and singing.

The Rabbitstick isn't the only primitive rendezvous, though. BOSS also holds "Wintercount Rendezvous" near Phoenix in February. Tribe (see Ben Pressley in the group) holds "The Tribe Gathering" in June in North Carolina. "Rivercane Rendezvous" is in the spring in Georgia, "Northern Lights" is in BC, Canada in June or July. and Earth knock has "The Gathering" in June in Colorado. There's more I am sure, but that's what comes to mind at the present.

That's about it in a nutshell. I hope this typed meandering has been helpful. Thanks, FP

X-Mozilla-Status: 0001

I just discovered a new web page made by Dean Pritchard of Boise, Idaho. Actually, it is under construction, but has some great gif art already. The page has darts, arrows, axes, knives, etc. that Dean makes. He is also an atlatl thrower and his email address is: Atlatlist@aol.com

Perhaps the most intriguing thing I noticed on his page is that he makes knife blades out of recycled beer bottles. Note the following passage:

"The knife features a unique blade which is created from recycled beer bottle glass. This glass is remelted in a ceramic kiln to produce a blank which is then hand-flaked in the same manner as obsidian. The outcome is an attractive amber blade which is carefully hafted to a fire-treated wood or antler handle with hidden adhesive and a wrapping of artificial sinew. The knife has an average blade length of 8 inches and a handle of 6 inches."

My question is: Does beer bottle glass have good properties for knapping and does it have similar strength/toughness properties of other popular natural materials? Has anyone else tried doing this? What a wonderful way to recycle if it works!

Hi Chris,

The QuÈbec ministry of natural ressources forces QuÈbec residents to follow courses before obtaining hunting permit or trapping permit. The trapping license course is offered by the "Association des trappeurs du QuÈbec" and consists in 45 hours theory plus a couple days out in the field. It is rather simple, with content such as biological data on all the fur bearing animals, how to prepare furs for sale, track and scat identification, types of legal traps etc. There is next to nothing on primitive stuff (it's illegal). Basically it's a course to get the piece of paper which then lets you go out and learn for real.

Cheers,

AndrÈ the mouse trapper.

Thanks for the background on the trappers licensing in Quebec. Sounds like the hunter safety and mine safety courses I've needed to take in the U.S. If a couple people near me hadn't died from Hanta virus, I'd ask you for your rodent recipes. Might be better than bug bits . While I'm meandering, are you getting any Lyme's disease from deer ticks up your way? Most of the people in my wife's family (in wooded upstate New York) have contracted it and needed long IV runs of antibiotics.

Take it easy (I am),

Blazo

I've been reading about Tom Brown on the list and wanted to point out

Matthew's "Thrower" Survival page link to "The Tracker", Bo Gulledge's "Unofficial TOM BROWN, Jr's Tracking, Nature, and Wilderness Survival School website. It's set up for students of Tom Brown and includes some of TBrown's writings, a book list, some great links, et al:

<http://www.csee.usf.edu/~gulledge/tracker.html>

.....

There's also information for subscribing to their list:

"Subscribe to the TRACKERS List Server and share with other tracker students

(For the subject of the message type "subscribe")

(If you ever decide to unsubscribe mail [trackers-d-request@muskoka.net](mailto:trackers-d-request@muskoka.net) but use the word "unsubscribe" as the subject)"

.....

>>Kevin wrote:

I have been taking classes from Tom Brown for the past 6 years, and for the past three years have edited his newsletter "True Tracks."<<

>>Hi Kevin, I would like to hear more about this newsletter. Where can we get it, what is the content, etc.

Thanks,

AndrÈ<<

If you call the Tracker School at (908) 479-4681 and request to be added to the mailing list, they will send you a course ctalog and you will

automatically get True Tracks. (Snail-mail - P.O. Box 173, Asbury New Jersey, 08802) True Tracks is the school newsletter. It is about 16 pages long, comes out (approximately) twice a year, and contains short articles by the school instructors on various elements of school philosophy and skills, information about new classes, updates on events around the school. You can see previous editions on-line at the school's website. The URL is  
<http://members.aol.com/trackerinc/index.html>

One of the things I am going to be doing this coming year is reformat True Tracks into more of a magazine. We will call for articles on primitive skills and philosophy to be submitted. We will accept advertising, we may publish a networking section. So if you want to get published, watch here. I will make more announcements later in the year.

Hope that helps.  
Kevin

Subject: Updated Boomerang Software

CC: THROWER@dfw.net, Primitive-Skills-Group@uqac.quebec.ca

Content-Type: text/plain; charset="us-ascii"

Status: U

X-Mozilla-Status: 0001

If you have received this email message and you do not subscribe to the thrower, rang\_list or Primitive Skills email subscription services; and you do not want future notices about boomerang related products, tournaments, and other information, please send me an email message and I'll remove you from my email database. If you do have an interest in boomerangs, please read further.

This is just a short note to let boomerangers know that I spent several hours updating all the boomerang software disks. A complete list of all software can be found at the following URL:

<http://ic.net/~tbailey/Boomerang/Shareware.html>

Some of the software highlights include:

1: Three complete books about boomerangs with drawings, photographs, etc. These three books are out of print classics that are required reading for anyone who is interested in boomerangs. Every photograph and drawing from the original text is included. These books are available in MS Word 2 (readable with higher versions too) format for DOS/Windows and MS Word 5 (and above) format for Macintosh. Other word processing applications may be able to open these files as well, but I can't guarantee anything. The three boomerang books include:

Michael Hanson's Book: "The Boomerang Book"

John Mauro's Book: "An Introduction to Boomerangs"

Herb Smith's Book: "Boomerangs; Making and Throwing Them"

All three of these books have been replicated with the permission of the copyright owners and I have been granted a license to distribute these files to you as shareware. That means that your only charge is my fee to copy and mail it to you. You may not market these files commercially to others.

2: The boomerang databases have been updated as of 1 January 1997. Some of the more popular files include:

a comprehensive bibliography of boomerang literature

an updated listing of collectable boomerangs with a full description of physical characteristics and collectable value

two comprehensive databases of: USA (1700+) and Overseas (1300+) throwers. This includes everything from addresses to phone/fax/email. This is an excellent source of information for finding other throwers in your city/state/country and for organizing local boomerang throws. You may not use these files for commercial purposes.

Please don't ask for database files in Mac, DOS or WIN formats. These are operating systems, not applications. The available Mac/DOS/Win file formats are listed on the web page mentioned above. Most word processing, spreadsheet and database applications can read the generic tab-text format or can import files from one of the other formats listed. Word Processing and Spreadsheet applications have only limited sorting capability. A database program is preferred for using these files. The files were created using Macintosh MS Works 4.0 and then translated to the other formats.

There are a lot of other software goodies too. Sorry, but I cannot email these files to you, even if you are related or my best friend. You need to order them through the mail. If you live in the USA or Canada and want a printed copy of the software list mailed to you, send me your postal address by email. As a January special, current Boomerang News (paid through issue #33 and beyond) subscribers are entitled to receive their disks without a shipping charge. Orders received after 1 February 1997 will require shipping unless ordered with other boomerang products. You can subscribe to Boomerang News through the instructions on the web page: [http://ic.net/~tbailey/Boomerang\\_News.html](http://ic.net/~tbailey/Boomerang_News.html) New subscribers will receive a 10% discount coupon on Boomerang Man products.

Thanks for taking the time to read this. - Ted Bailey

Does anyone on the list get the Wilderness Way Journal? From reading the info on their website, it looked as though it

would be very helpful for primitive skills learning.

In October, I sent off for Volume 2 issues 1 and 3 to get a sample to check them out. According to the back of my check, they had it by Oct 24 when they cashed it. I tried emailing them from their website not to long ago as well but haven't heard anything.

Does anyone know anything about their situation or schedule? Anyone got these issues or any others and want to talk about the interesting articles?

Sharon,

I have subscribed to WW since the first issue. I find it interesting, informative, way to short and to long between issues :)

It only comes out quarterly. I know they are always looking for articles as well. Steve Hulsey is the Editor/Publisher and also publishes Primitive Archery

magazine. Need anything else?  
Light &Life,

eddie

Sharon, I just last week called Wilderness Way Magazine and ordered a subscription as well as back issues. They told me to expect 6 weeks for the current issue and 4 weeks for the back issues. I got the impression that they are alive and well. Their phone # is 409-632-8746, and they're in Texas (2 hr. time difference). Good luck.

>Sharon

Yes Sharon, I have every issue but the first. I had no trouble getting the  
subscription started. I think the articles are for the most part written by  
amateurs, but usually interesting and informative. In particular, I like  
the series by John and Geri McPherson (and a 14 year old neighbor boy)  
entitled "Naked Into the Wilderness" in which they are describing in  
installments a simulated trip into the wilderness with nothing but the  
cloths on their backs (could not use for anything but covering) and the  
knowledge in their heads. This adventure starts with Volume 1, Issue 4.

Sherri,

You might try SUWS Adolescence at: 714-895-0923. If that number is  
out-dated then try the Idaho field office at 208-886-2565.

My wife and I both worked at SUWS and some of the other programs.  
Not all adolescent programs are created equal, and kids have died on the  
trail out of pure negligence. SUWS is very safe; all the instructors wear  
radios, so backup personel can be there in minutes on ATV's or with a  
helicopter if necessary. Also, the school gives training sessions before  
every expedition, covering survival skills, counseling techniques, etc.  
The business did change hands recently, but I would expect the same  
quality. Larry Olsen helped with this program before starting Anasazi.

Please note that none of these programs are cheap. You can expect  
to pay \$5,000 or more for a 3 week expedition. Sometimes insurance covers  
the cost.

Always Peace,

Thomas J. Elpel

I will pass this on to Glenn. I am afraid tho that these will be more than he can fiancially afford. THis is the sad part. The kids that need these type of things most are "outpriced". hummmm...perchance there is a need for low income type of primitive rehab that rescues our average everyday kids. This would help to re-direct their destructiveness in to a positive direction. Most of our kids that are in trouble are either bored and/or unable to have any purchasing power...unconnected. My son is 25 but I would have loved to send him to one of these when he was younger. But I am rambling...thats for your imput. I will pass it on.

smiles,

Sherri

The AEE web site can be found at <http://www.princeton.edu/~rcurtis/aee.html>

I really like the type of people this organization attracts. So, if you were involved with this organization in the 80s have you met Bert Horwood? I have a feeling you know him? I've just hooked up with AEE the last year or so... so I don't know much about the internal organization. I went to the International Conference in '96 and got hooked! It was awesome. It was the first time I felt I could bump elbows with professionals who weren't stuck up high on that academic pedestal. They were all \*real\* people. I learned more at that conference than I had in all my schooling to become a special educator.

Trying to stay warm in the WI winter storms ;)

I'm sending you a rather lengthy list. I hope you find someone near you. I have marked the ones that are a little higher priced with a \$ sign. They are worthwhile, though. Most of them have plant knowledge, some as indicated, specialize in plant knowledge. Also check out the publication below, Wild Foods Forum. Vickie shufer is editor and can help you find someone also. I would also contact Christopher Nyerges at Survival Services below. He is one of the best out your way on plants. Let me know how else I can help!

PRIMITIVE, SURVIVAL AND WILDERNESS LIVING SKILLS TEACHERS:

Barry Keegan, Pathways School, 6 Heather Lane, Elmsford, NY 10523,  
Phone: (914) 592-8961

He and his partner, Anthony Follari are two of the most skilled people I have met. They communicate well and their experience in the field is apparent. Write for a full schedule of their classes.

Bear Thistle, Jim & Gloria Robbins, P.O. Box 429, Dudley GA 31022,  
Phone: (912) 676-4120

Jim and Gloria teach many primitive skills. Primitive drilling techniques, stone carving, basket making, bag weaving and much more. They also sell custom made jewelry.

\$ Boulder Outdoor Survival School, Inc., P.O. Box 1590, Boulder, CO 80306, Phone: (303) 444-9779

B.O.S.S. has much to offer In primitive and survival skills workshops from a week to 27 day long hands-on training. Write for a schedule of classes and products they have available. They are also a good resource to connect you with some particular craftsman, book or resource you may be having trouble locating. Dave Wescott is director and is well known for his contributions and and skills in primitive and survival technologies. He organizes Rabbit Stick Rendezvous and is editor of the Bulletin of Primitive Technology.

Camp Antiquity, Ken Sherron, 131 Ranch Dr., Ponca City, OK 74601, Phone:  
(405) 765-3722

Training camps in primitive skills. Regular courses include 5 day intensives in brain tanning, flint knapping, friction fire making and cordage. Classes usually run Monday through Friday. Weekend classes by appointment. Family oriented. Drugs and alcohol prohibited.

\$ Errett Callahan, Piltdown Productions, 2 Fredonia Ave., Lynchburg, VA 24503

Errett Callahan specializes in and conducts workshops in flintknapping, primitive skills, archery, etc. and sells stone knives, flintknapping supplies and a starter set for the beginning flintknapper, complete with instructional flashcards. Catalog available. He is very renowned worldwide as an exceptional experimental archaeologist. He is founder of the Society of Primitive Technology.

Eustace Conway, Turtle Island Preserve, Rt.1, Box 249B, Triplet, NC 28686, Phone: (704) 872-7972

Native American Culturalist. School programs, teacher workshops and Museum presentations available on various Native American skills. Braintan hides for sale. Brochure available.

Flintworks, Scott K. Silsby. 6604 Placid St., Falls Church, VA 22043, Phone: (703) 533-0056

Scott is the best teacher and tool maker, when it comes to greenstone tools. He also teaches workshops in flintknapping, bow and arrow making and sells greenstone and greenstone tools.

Hawk Hurst, E.A.R.T.H. Programs, Silver Water Retreat, Hawk's Hoops, 2511 Bald Fork Rd., Todd, NC 28684, Phone: (910) 385-1401

Rainsticks, Bamboo, Gourds and instruments, such as, drums, rattles and flutes, for sale. Hawk Hurst has workshops to offer that allow you to create and build your own drum, flute, rattle and rainstick. They also have E.A.R.T.H. Programs (Earth Awareness programs/Re-experiencing Tribal Heritage), Primitive Skills Summer Camps for-ages 7-12, Wilderness Weekend Survival Treks and Family Camp Weekends. Hawk and his wife Ayal now conduct classes at beautiful Silver Water Retreat A 214 acre site with waterfalls, a refuge for all plant and animal life. Silver Water Retreat offers examples of low Impact, environmentally appropriate technology', environmental skills and many programs through the educational center. It is also a place of seclusion for peaceful retreats and encounters while one explores their own personal creativity. Plans also include a replicated village of primitive shelters from around the world and a community of people to live on site permanently as part of the program and goals they envision.

HOFUNEE Southeastern Indian Programs, Scott Jones, P.O. Box 2446, Athens, GA 30612, Phone: (706) 743-5144

Scott has some very good workshops in various primitive skills. He has appeared on TV on such programs as Earthmatters and Earthnet. He is very skilled and very entertaining. He also sells rivercane for blowguns and arrows.

Jeff Holshouser, 8535 Bringleferry Rd., Salisbury, NC 28146, Phone: (704) 639-9082

Jeff teaches some excellent workshops on flintknapping, especially

for those just starting out in flintknapping. He also collects artifacts and sells casts of originals and will do other replication.

Jim Lowery, Earth Skills/dirt times, 1113 Cougar Court, HC 2, Box 8132, Frazier Park, CA 93225,  
Phone: (805) 245-0318

Jim directs a variety of primitive skills classes and tracking. Also ask about their great little newsletter that focuses on tracking, wilderness skills and nature awareness. It comes out quarterly and focuses on the Southern California area, but has some good information that would be good for any area. Not only do they have articles on tracking, they also have articles on many primitive technologies. Back issues are available and a catalog. Subscription Price is \$12.50 (\$15.00 International)

Jim Riggs, Contact: Lucille Housley, Malheur Field Station, HC72, Box 260, Princeton, OR 97721, Phone: (503) 493-2629

Specializing in primitive technologies and living skills. Workshops available, write for schedule and locations.

Jim Roberts, 111 W. Trinity Ave., Durham, NC 27701, Phone: (919) 688-1430

Cross cultural percussionist, hand drum teacher, drum maker, instructional tapes for sale.

John C. Campbell Folk School, Brasstown, NC 28902, Phone: 1-800-FOLKSCH  
School specializing In various folk and ancient skills and crafts. Catalog available.

John McPherson, Prairie Wolf P.O. Box 96, Randolph, KS 66554, Phone: (913) 293-5310

Workshops available In various primitive living skills. Books and videos for sale.

John White, Ancient Lifeways Institute, Michael Hollow Rd., Michael IL 62065, Phone: (618) 576-9255

Educational center specializing In Midwestern Native American life and skills 300 years ago.

Keith Grenoble, 1012 Madison Lane, Falls Church VA 22046

Keith is very skilled in many different primitive living skills. He is an excellent, good natured patient teacher.

Linda Runyon, Wild Foods Co., Inc., 13239 W. Shadow Hills Dr., Sun City West, AZ 35375, Phone: (602) 933-8675

Linda Runyon knows edible and medicinal wild plants. Linda learned from the Iroquois people while living in the Adirondack wilderness for 13 years, She was once on Ripley's Believe It or Not TV show for feeding 200 people a banquet from harvesting a 10 foot square of yard for 15 minutes a day for three weeks! Wild Foods Classes every Wednesday, 7-9p.m.

Living History Workshops, The Berkeley Museum, 950 Story Landing Rd., Moncks Corner, SC 29461,

Phone: (803) 899-5101, Contact: Mark Butler

Mark Butler is the program director and has classes in many different primitive skills to offer.

'Mountain' Mel Deweese, Learn To Return/Survival Experience Reaction Education/Nature Knowledge, 1825 Linden St., Grand Junction, CO 81503, Phone: (303) 242-8507

Mel is very highly skilled in many primitive and survival skills. He knows more ways to start a fire without matches than anyone I know. He has trained Navy SEAL's and various military personnel in tropic, desert, arctic, mountain and woodland conditions. He is featured on one of the Woodsmoke videos, Fire III. He is not only a good teacher, but is also very entertaining.

Musselshell Traders. Paul & Snowbird Dinsmore, HCR 67, Box 11, Mosby. MT 59058, Phone: (406) 429-7828

Teaches Northwest Coastal Native American (Colville, Kootenai, Blackfoot, Cree) tanning method. wet scrape, smokes, then brains hides. Also sells finished hides and trades 7 scraped hides to 1 finished hide.

Nature & Vision Tracking School, Charles Worsham, RFD 4, Box 446 Thomas Rd., Madison Heights, VA 24572, Phone: (804) 846-1987

If you're looking for classes in tracking Charles Worsham is one of the best. He teaches animal and man tracking. Write for brochure.

Kathleen & Preston Roberts, Rt. 1, Box 200-A, Hays, NC 28635, Phone: (910) 957-3459

Two very skilled and gifted teachers of primitive skills. Preston is also a fine braintanner and makes buckskin clothing.

Steve Watts, Schiele Museum of Natural History, P.O. Box 953, Gastonia, NC 28053, Phone: (704) 866-6912

Director of Southeastern Native American and Aboriginal Studies Program at Schiele Museum. Write for schedule of workshops available in various aboriginal skills with emphasis on the Southeastern Native American. Replicator of Southeastern pottery, points, etc.

Steven 'Snow Bear' Taylor, Yonah Earthskills, Rt. 5, Box 396, Hayesville, NC 28904, Phone: (704) 389-9336

Specializing in primitive and pioneer living skills, edible, utilitarian and medicinal wild plants, tracking, stalking, nature awareness, storytelling, music and primitive cooking. Available for contract work. Brochure available. Co-organizer and founder of annual Earthskills Workshop/Rivercane/ Falling Leaves Rendezvous in Unicoi State Park, Helen, Georgia.

Survival Services, Christopher Nyerges, P.O. Box 41834, Los Angeles, CA 90041, Phone: (213) 255-9502

Wild food outings. Classes in survival. Products.

TACACHALE Programs, Sam Lawson & Ann Gill-Lawson, 871 Willis Lane, Dublin, GA 31021, Phone: (912) 274-9008

'Tacachaleí means 'to light a new fire'. They teach ancient principles and practices through material culture, primitive skills, legends, stories and southeastern ethnohistory in order to bring new understandings in environmental and cultural studies.

The Chapman Log House Building School, Don & Bonnie Chapman, Rt. 8, Box 739, Mooresville, NC 28115, Phone: (704) 663-5080

Don Chapman is a log home builder, artist and historian. He teaches

traditional Appalachian log home construction techniques.

Tony Breda, The Swimming Turtle, 1322 Dalton Rd., Towson, MD 21234,  
Phone: (410) 882-9339

Tony offers classes in edible wild foods, aboriginal daily skills (primitive cooking, hide tanning, shelter construction, etc.), primitive tool making, native fishing techniques (spears, nets, traps, etc.) modern wilderness survival, primitive pottery and basket making, Living with the Earth (survival campouts). Classes at various locations in Maryland, Virginia, Yukon and Great Britain. Also makes and sells great dugout canoes suitable for museums or for using.

TRIBE, P.O. Box 20015, Charlotte, NC 28202, Phone: Benjamin Pressley  
(704) 827-0723, E-Mail: [tribe@perigee.net](mailto:tribe@perigee.net)

Visit us on the Internet: <http://users.aol.com/tbprim1/Tribe.html>

TRIBE is an organization dedicated to bringing together people interested in primitive technologies on a regional basis and providing a medium whereby knowledge and resources may be shared with one another. This is accomplished through the regional newsletter, TRIBE, the annual primitive skills event, TRIBE GATHERING and co-ordinating with, co-operating with and promoting primitive skills teachers and practitioners of primitive technologies.

TRIBE has a year long schedule of workshops and classes in many primitive, outdoor and survival skills and crafts. We handle some of the best primitive skill instructors in the country. To find out about our exciting schedule request free TRIBE Information Packet or check out a sample of the newsletter only \$2.50.

TRIBE also offers a service to any primitive, outdoor or survival skill teacher or practitioner that wishes to teach. TRIBE offers their service as a staff, provides promotional literature, advertising, provides students and collects all fees. The guest instructor receives their required fee and TRIBE charges 20% over the guest instructor's required fee. This money pays for expenses of this service and the rest goes back into the organization for future expenses to benefit primitive skill practitioners everywhere who know of and benefit from TRIBE.

Willow Winds, Jim Miller, Director, 962 F-30 West, Mikado, MI 48745,  
,Phone: (517) 736-3487

Jim is an experienced braintanner and offers workshops in braintan and many other primitive skills. He has replicated items for the movies, such as Dances With Wolves, Thunderheart and others. He has braintan buffalo and elk hides available for sell.

Workshops In Primitive Living Skills For Children And Educators, Jeff Gottlieb, 57 Westgate Rd., Massapequa, NY 11762, Phone: (516) 232-2903

Abo Replicas: Shelters, Tools, Games and Toys/ Natural Creations: 'Wild' Baskets, Rattles, Fiber Art Jeff has many programs to offer adults and children and is very qualified. Here are some of his offerings: Life Zones of Planet Earth/ Primitive Technology/ The Deer People/ Wilderness Survival/Ancient Days and Native Ways/ Stories From the Earth Write for price list. "I look at survival and aboriginal living skills as a way to get closer to the Earth, which supports us all as a mother cares for her children. I teach in order to help people reconnect with the web of all life." --Jeff Gottlieb.

THESE MAGAZINES, NEWSLETTERS AND ORGANIZATIONS ARE ALSO A GOOD RESOURCE

WITH A LOT OF GOOD INFORMATION TO OFFER AS WELL AS WHERE PEOPLE  
ADVERTISE CLASSES:

Backwoodsman Magazine, P.O. Box 627, Westcliffe, CO 81252, Phone: (719)  
783-9028

"The Magazine for the 20th Century Frontiersman Specializing In  
Trapping, Woodlore, Survival, Gardening, Muzzleloading and  
Homesteading". A great all around magazine! \$15.00 per year. \$28.00 for  
2 years.

Backwoods Home Magazine, 1257 Siskiyou Blvd., #213, Ashland, OR  
97520, Phone: (805) 647-9341

A really great magazine on all aspects of self reliant living; home  
building, alternative energy sources, farming/gardening, health,  
environment, etc.

Boomerang News, Ted E. Bailey, P.O. Box 6076, Ann Arbor, MI 48106  
News on Boomerangs, Rabbit sticks from around the world. \$10.00 per year  
(\$12.00, Canada. \$20.00 Overseas).

Bulletin of Primitive Technology, Society of Primitive Technology, P.O.  
Box 905, Rexburg, ID 83440, Phone Voice/FAX: (208) 359-2400

More than a magazine, the official bulletin of the Society of  
Primitive Technology. The most highly technical, yet understandable,  
magazine on various primitive technologies I have ever read. Contains  
articles by all the big names in these technologies. Join the Society  
and order their back issues while you can at \$10 per issue. Free  
classifieds for members. \$25.00 year. Subscription price includes annual  
PrimitiveTechnology Newsletter.

Coltsfoot, Rt. 2, Box 313A, Shipman, VA 22971

A bi-monthly newsletter published in appreciation of wild plants.  
Contents include articles on edible and medicinal plants. Subscription  
Rate: \$10.00 per year (Sample Issue: \$2.00)

dirt times, Published by Earth Skills, 1113 Cougar Court, HC 2, Box  
8132, Frazier Park, CA 93225,  
Phone: (805) 245-0318, Editor: Jim Lowery

Great little newsletter that focuses on tracking, wilderness skills  
and nature awareness. It comes out quarterly and focuses on the Southern  
California area, but has some good information that would be good for  
any area. Not only do they have articles on tracking, they also have  
articles on many primitive technologies. Back issues are available and a  
catalog. Subscription Price is \$12.50 (\$15.00 International)

Herbal Voices, 3936 Mt. Bliss Rd., East Jordan, MI 49727

A quarterly newsletter for plant crafters. It has articles on medicinal  
plants, edible plants and many other plant related topics. They are also  
forming a network for people who use herbs. Subscription Rate: \$12.00  
per year

South Linden Rd., Suite 119, Flint, MI 48507

Newsletter on various primitive skills and activity focusing on activity  
in the Great Lakes area. \$10.00 per year

Michigan Flintknapper's Newsletter, Robert Love, 8185 Kiowah Trail,

Pinckney, MI 48169

The newsletter of the Michigan Flintknappers about flintknapping. \$10.00 per year.

Pathways, The Newsletter of the National Association of Therapeutic Wilderness Camps, NATWC, 174 Underwood Farm Rd., Cleveland, GA 30528

This an organization that is a network of camps that uses wilderness living skills as a tool to reach troubled youth with a therapeutically sound, non-punitive approach. They hold an annual conference and have such distinguished members on their board, such as Larry Dean Olsen (ANASAZI Foundation, Outdoor Survival Skills). \$25.00 per year or join their organization with full benefits for \$40.00 (Individual), \$30.00 (Full-time student).

Pow-Wow Listing, John Blackfeather and/or Lynette C. Jeffries, 511 Latimer St, Hillsborough, NC 27278,  
Phone: (919) 732-8512

A one page newsletter that lists Pow-wows going on all over. Subscription price is three self addressed stamped envelopes. send to address indicated,

Pow-Wow Trails, P.O. Box 1188, Long wood, FL 32752-1188

Extensive listings of Pow-Wows and articles. Subscription Price: \$12.00 year--I 2 issues

Prehistoric Antiquities & Archaeological News Quarterly, Dept. 301, Box 53. N. Lewisburg, OH 43060

Prehistoric artifacts for sale and trade, articles on current archaeological findings and research, calendar of events for meeting, auctions and shows, books and supplies. To Subscribe: Sample, \$5. 1 Year Subscription (4 issues). \$20 (Canada \$4. Sample, \$6)

Primitive Archer, P.O. Box 209, Lufkin, TX 75902-0203, Phone: (409) 632-8746.

This magazine is dedicated to the primitive bowyer, hunter and archer. They deal strictly with wooden bows, not compounds, not artificially laminated. Articles on choosing bow woods, flintknapping, constructing bows, tales of hunting and hunting how-to with primitive bows, romance of the bow and primitive hunt, arrow making, resources... just about anything having to do with primitive bow and arrow making, hunting or archery. They also have a bowyer's help line, network exchange of tips and information and opportunities to trade hunts. Subscription price is \$16 per year. Canada \$24, Foreign \$31. Published quarterly.

The Caretaker Gazette, 1845 NW Deane St., Pullman, WA 99163-3509, Phone/FAX: (509) 332-0806, E-mail: [garydunn@pullman.com](mailto:garydunn@pullman.com) Here is an idea worth considering. How would you like to have your housing provided by a landowner and live rent-free with no mortgage obligations? It is possible as a property caretaker. There is an increased demand for property caretakers across the U.S. watching over someone's property in their absence and in some cases on nature retreats, ecological preserves, camps, national and state forests. Thea Dunn is doing a great service and has researched this field and has began a publication called The Caretaker Gazette. If you are interested, this newsletter is worth receiving. Subscription Price: \$15.00 (6 months, 3 issues), \$24.00 (1 year, 6 issues), \$44.00 2 years, 12 issues).

The Cast, 7273 Hamburg Rd., Brighton, MI 48116, Phone: (810) 231-2314

Recently, Lou Becker, Ron Rappaport, George Hedgepeth and Jim Gilligan organized a group called the Michigan Atlatl Association, They have a great newsletter to offer that will keep you informed about the many atlatl and primitive skills events going on in the Great Lakes area. Lou Becker had the idea of starting an atlatl association in Michigan and they already are planning a boar hunt and some patches with their great looking logo on them. They will be networking with many other groups like TRIBE. It's great to see people getting together and networking, so we can support one another. If you're Interested in joining send \$10.00 dues to: Lou Becker, President, 5940 Urban Dr., East China, MI 48054, Phone: (810) 765-4623.

The C.R.O.W. Call, P.O. Box 187, Bogota, NJ 07603, Phone: (201) 48& 0446

The quarterly newsletter for Children Respecting Our World, A fine newsletter that deals with many environmental issues and just general respect for the earth. They are also an organization that teaches primitive skills and holds an annual rendezvous. Well written and entertaining. Subscription Price is \$10.00 per year.

The Food Insects Newsletter, Florence V. Dunkel, Ph.D., Associate Professor, Editor, Dept. of Entomology, Room 324, Leon Johnson Hall, Montana State University, Bozeman, MT 59717-0302, U.S.A. Phone: (406) 994-5065. FAX: (406) 994-6029.

E-mail: [UEYFD@MSU.OSCS.MONTANA.EDU](mailto:UEYFD@MSU.OSCS.MONTANA.EDU)

This is the first newsletter I've ever seen dedicated to eating insects! That's right, I said, eating insects. Great newsletter that contains recipes on preparing insects as food like Hot Mealworm Appetizers, Mealworm Cookies, Mealworm Canapes, Marinated Termite Queens, Bee Larvae Dip, Chocolate Covered Crickets, Locust Brochettes. Makes me hungry! They actually sponsor insect tasting feasts for the public. The newsletter comes out March, July and November and costs \$5.00 per year (Back issues: \$1.50).

The Flintknapper's Exchange, 278 W. 8th St., Peru, IN 46970

A clearinghouse for knappers. Bi-monthly newsletter. Subscription Rate: \$12.00 per year.

The Wild Foods Forum, P.O. Box 61413, Virginia Beach, VA 23462

Wonderful bi-monthly newsletter dealing with wild, edible and medicinal plants. Articles, recipes, resources and reviews. Vickie Shufer is the Editor and she and her staff do a great job. You will definitely want to check this one out. Sample copy: \$2.00. Annual Subscription: \$15.00. International: \$16.50.

TRIBE, P.O. Box 20015, Charlotte, NC 28202, Phone: (704) 827-0723,

E-Mail: [tribe@perigee.net](mailto:tribe@perigee.net)

Visit us on the Internet: <http://users.aol.com/tbprim1/Tribe.html>

Founded by Benjamin Pressley and Robert Likas . A newsletter for anyone who is interested in what is going on in primitive technologies on a regional basis. Free classifieds to members. Presently only \$10.00 per year for 4 Issues (\$14.00 for countries other than U.S.), a minimum, non-profit cost to cover printing and postage. \$3.00 for a sample issue. Also allows members to print biographies of themselves, wishes to contact others of like interests in their area, needs for raw

materials, workshops, products for sale or trade, anything of interest to the practicing primitive may be printed, primitive skills schools and events, articles, humor and much more.

TRIBE also handles many primitive skills instructors and has a year long schedule of classes and workshops in a variety of skills and crafts for anyone interested in primitive, outdoor, aboriginal, Native American and survival skills and crafts. For a complete listing of these workshops request the FREE INFORMATION PACKET.

The annual TRIBE Gathering is a weekend of learning primitive skills with some of the best instructors in the country. Held annually every year on the second weekend of June. A hands-on, family oriented learning experience for the serious primitive technologist as well as anyone interested in primitive skills.

Wilderness Way, P.O. Box 209, Lufkin, TX 75902-0203, Phone: (409) 632-8746

Internet Home Page: <http://www.pioneerpc.com/wildernessway/>

Steve started Primitive Archer magazine, and now also publishes this magazine with articles on many primitive skills. He is also attempting to support it with subscriptions alone so that display ads will not dominate article space

and offer free advertising in back to subscribers. Subscription Price: \$18.00 (U.S., Domestic), \$39.00 (Canada), \$49.00 (Foreign)

#### CLUBS/ORGANIZATIONS:

American Knife Throwers Alliance, c/o Bobby Branton, 4976 Seewee Rd., Awendaw, SC 29429,  
Phone: (803) 928-3624

Competitive knife throwing and newsletter. Membership: \$25.

Great Lakes Primitives, George Hedgepeth, Editor, G-3450 South Linden Rd., Suite 119, Flint, MI 48507. Internet Homepage:

<http://users.aol.com/tbprim1/GLP.html>

Newsletter on various primitive skills and activity focusing on activity in the Great Lakes area. \$10.00 per year.

Michigan Atlatl Association, 7273 Hamburg Rd., Brighton, MI 48116,  
Phone: (810) 231-2314

Internet Homepage: <http://ic.net/~tbailey/Primitive/MAA.html>

Recently, Lou Becker, Ron Rappaport, George Hedgepeth and Jim Gilligan organized a group called the Michigan Atlatl Association, They have a great newsletter to offer that will keep you informed about the many atlatl and primitive skills events going on in the Great Lakes area. Lou Becker had the idea of starting an atlatl association in Michigan and they already are planning a boar hunt and some patches with their great looking logo on them. Subject: Wet-scrape Resource

Content-Type: text/plain; charset="us-ascii"

Status: U

X-Mozilla-Status: 0001

Hi all,

A couple weeks ago I posted some wet-scrape resources. I mentioned that Steven Edholm and Tamara Wilder had a book out on Wet-scrape, but did not have the title or other information on it. I've since received a flyer in the mail. The book is called "Wet-Scrape Braintanned Buckskin: A practical Guide to Home Tanning and Use" ISBN 0-9654965-4-6 pr send \$17.95 plus \$3.00 postage to Paleotechnics, Box 876, Boonville, CA 95415.

Always Peace,

Thomas J. Elpel

Mark: There's a book out on dry scrape brain tanning that I found to be an excellent resource. It's called Blue Mountain Buckskin by Jim Riggs. It Costs \$12.00. Write him at 72501 Hiway 82, Wallowa, OR 97885 The Book is very well written and Jim has a great sense of humor. You'll find it answers a lot of questions. Even ones you haven't thought of yet!

There was a question of how do you get brains. Supposedly, each animal comes with enough brains to tan its own hide, but friends of mine that do a lot of brain tanning get pork brains out of the meat section at the grocery store ( you might have to hunt a bit. Not all stores may carry it).

Keep on Truckin'

Fox Fire is the luminescent rotting wood often found in the forest, at least here in the south. I have often seen it, sometimes in quantities large enough or bright enough to be useful for performing light requiring tasks, but not often. It is not a fire starter, and I have never heard it referred to in reference to actual combustion. You may have heard of the Fox Fire books (a series of 10 I think) which are interviews conducted by high school students, mostly of "experienced" people in the Rabun county area of North Carolina. I have the books, great info and reading, ISBN: 0-385-07353-4, 0-385-02267-0, 0-385-02272-7, 0-385-12087-7, 0-385-14308-7, 0-385-15272-8, 0-385-15244-2, 0-385-17741-0, 0-385-17744-5, and 0-385-42276-8. The series (of books, I think that there were magazines or articles earlier than that) started in 1973. Unfortunately, the editor and founder of the group was convicted of child molestation and ended his relationship with the group 2-3 years ago (I think).

Long post but I could talk more about the books, as to your original question, I think that foxfire (correct spelling) is interesting but of limited practical use.

I keep a file on the iceman and would be interested in anything you have  
to pass along, I don't read German, though. Thanks! Along the same  
lines, how about all those caucasian corpses found well preserved even  
down to the cloth clothing on the Chinese border! I know this isn't  
recent news but Discover magazine had some awesome photo coverage of  
these corpses.

If anyone has the name, address, phone, etc. of good tracking teachers (good strong physical tracking skills, no hocus-pocus) please pass them on to me (private e-mail, please) I have very few tracking teachers in my list of resources. I'd be glad to share the sources I know of. They need not be well known, just good at what they do and willing to share their skill. I'd particularly be interested in any teachers on the east coast of the U.S. I know about Charles Worsham in Virginia. I have recently been hearing about Mark Warren in Georgia. Anyone know anything about Mark? Any other teachers of tracking?

I took a weekend class from Paul Rezendes, author of "Tracking and the Art of Seeing" (ISBN 0 944475 29 9), an excellent tracking book that has tons of great pictures (he's a wildlife photographer) and is much more fun to read than Murie's book. I recommend both the book and the classes.

He takes a group of 8-16 people on a semi-random walk through the woods near his home. He or his assistant may have gone out earlier that day to look for something interesting. He points things out and answers questions as he goes. For example: Stunted hemlocks, crazy twisted beeches (oak? already I'm forgetting), cut-off oak and hemlock branches, curious two-by-two tracks in a straight line, scraped bark on the less-steeply sloped side of a white oak, and little cashew-shaped scat, all of which indicate browsing by porcupine. How you can study the branching pattern of mountain laurel and hemlock to get a history of deer population over the last five years. Pits where great trees once stood -- a tree falls out of its grave, not into it, and the pit remains long after the tree has disappeared. How coyote, otter, and weasel like to leave their scat in prominent places. That scat diameter is more indicative of species than length or volume. Debris piles and stash holes of red squirrels. Bare patches under hemlock trees used by deer bucks to announce their presence in mating season. Small clipped-off buds on blueberry bushes that tell you how many rabbits are about. He also told us what not to look for: wintergreen, partridgeberry, and red cedar are not mammal food and tell us little about deer or rabbit populations. We saw so much scat I'm amazed I could ever walk through the woods without coming back with shit on my shoes.

Walking with Paul leads me to believe that seeing what is in the wilds is not a matter of increasing your "awareness", but of knowing what to look for.

He wasn't really interested in tracking down animals. He doesn't study minute details of tracks to try to follow a trail. He just needs a few tracks to tell him that a fisher was here yesterday evening, and he knows what the fisher was probably doing. He says the way to find animals, whether you are a hunter or a nature photographer, is not to know where an animal has been, but where it is going to be. Once he has looked over the patterns in the woods he can predict with reasonable accuracy who will be where when.

After the classes I took a walk in the Catskills, looking for any of the things he had pointed out. I was excited to find a strange, tubular brown scat, composed of woody bits in some sort of brown leafy wrapper. Paul says that scat scent is often the best clue to its origin, and it proved so in this case -- what I had was a stomped-on soggy cigar.

If you know someone who knows these sorts of things, then of course you don't have to go all the way to Masseurussetts. I suppose you could gain similar knowledge from taking walks with anyone who spent a lot of time observing nature. But for those of us not lucky enough to know any such person, Paul's classes are great.

Charles Worsham is the best by far. Tom Hanratty is another good tracker but he is in Wisconsin. He runs Medicine Hawk Wilderness Skills in Milwaukee (414)482-8722. Tom teaches animal tracking classes and classes on "forensic tracking" (using tracking skills in crime scene analysis etc.) also as he is a former medical examiner for Milwaukee County.

To go a bit further a field I have heard good things about Jim Lowry in California and a guy named John Stokes, although I don't have addresses or numbers for either. I can get them and post them on the list. Another good tracker on the east coast is Paul Rezendes. I believe he is located in New York (but I could be wrong about this). Paul is the author of "Tracking and the Art of Seeing". He is a photographer by trade. Another tracker that comes to mind that I would recommend is James Halfpenny. Jim is the dean of "scientific trackers" and the author of "Mammal Tracks of North America". He's good. Sorry I don't have addresses for any of these people other than Charles Worsham. For those interested, his address is:

RFD 4, Box 446 Thomas Rd.  
Madison Heights, VA 24572

Mark

Jim Lowery's address is:

Jim Lowery, Earth Skills/dirt times, 1113 Cougar Court, HC 2, Box 8132,  
Frazier Park, CA 93225,  
Phone: (805) 245-0318

Jim directs a variety of primitive skills classes and tracking. Also  
ask about their great little newsletter that focuses on tracking,  
wilderness skills and nature awareness. It comes out quarterly and  
focuses on the Southern California area, but has some good information  
that would be good for any area. Not only do they have articles on  
tracking, they also have articles on many primitive technologies. Back  
issues are available and a catalog. Subscription Price is \$12.50 (\$15.00  
International)

Most seeds purchased for consumption will not germinate. The seed companies have hybridized their varieties until only their farms can plant and harvest germinating seeds. If you buy seed corn and plant it, the corn you harvest will not germinate. There are some natural seed companies that may be able to help you. Try herbnet :

<http://www.herbnet.com/university.html>

Maybe others will know more of this.

Check out Del Hall at

Nature Awareness School  
PO Box 219  
Lyndhurst, VA 22952  
(540) 377-6068

He has a great school just off the Skyline Drive. He teaches survival skills, nature observation, tracking, native philosophies, edible plants, tanning, and log cabin building. Highly recommended.

>love to hear about your experience.

I just finished listening to Jon Young's tape series "Seeing Through Native  
Eyes". The sound quality was not good and there was not a lot of specific  
information. But perhaps even better, it contains a very good plan for self  
study complete with suggested readings. The benefit of a good teacher is  
that they can suggest what to value and pay attention to and what to avoid.  
And they can suggest exercises that save a lot of trial and error time. The  
tape series offers this.

I've taken a couple of classes with Paul Rezendes. He's from Western Massachusetts. He is good at sign tracking, and is self-taught. He doesn't put much faith in aging tracks, micros and macros, etc. He's most comfortable around the Quabbin it seems.

> >Jewelweed (*Impatiens capensis*) is a good remedy, but it does not grow in

my  
> >region.

>From the book "The Encyclopedia of Medicinal Plants" by Andrew Chevallier, DK Publishing, Inc., 1996.

Chickweed (*Stellaria media*) cream is very effective. This is made by combining about 50 grams of the fresh herb with 150 grams of emulsifying wax (this is made by combining oil or fat with water into an emulsion, best done slowly in a blender or something similar - like making mayonaise), 70 grams of glycerine and about 80 ml of water. Heat it all up and simmer for about 3 hours, then strain through a jelly bag. put in small jars and store in the refrigerator.

For most effective relief, this treatment can be combined with an infusion of 5 grams (dried herb) of each of the following: Nettle (*Urtica dioica*), Heartsease (*Viola tricolor*), and Calendula (*Calendula officinalis*) in 750 ml of water taken regularly during the day. Or: A decoction of 5 grams of the root of each of the following: Dandelion (*Taraxocum officinale*), Yellow dock (*Rumex crispus*), and Burdock (*Arctium lappa*) in 750 ml of water. Drink 2 cups a day.

This all sounds kinda complex, but if you really have a problem with the nettle rash....

This book is an excellent source of information and I would highly reccommend it to any seriously interested in herbal remedies and the like. Although it is a bit pricey (\$40.00), it has more info than a handful of cheaper books combined.

BTW, for those interested in medicinal plants, check out the "Medicinal Plants of Native America Database" at:

<http://probe.nalusda.gov:8000/related/aboutmpnadb.html>

This and a bunch of other interesting plant info is at the National Agricultural Library of the USDA.

Once you get to this site hit the "query" link. At this point I would recommend doing the "Fuzzy Search" option. You will have to select the MPNADB database (and/or some other ones) and hit "search" to get an input form.

This is an enormous database with everything cross-linked. It may seem too complicated at first glance, but play around a bit - there are tons of info there.

If you have that book by Nancy Turner, hold on to it. They are out of  
print and very  
hard to find. They are re-releasing some of her books by different  
publishers, but it  
is slow work.

Nancy teaches at the University of Victoria in Victoria British  
Columbia. I will look  
into getting an address or email address for her.....stay tuned.  
Mark

Postal Paranoia: the reluctance to post questions or comments due to the fear of having one's THREAD BIT OFF! ( boo, hiss, sick pun ) OK, OK, I just couldn't resist.

Actually, this silly posting pun may be quite appropriate given the content of recent discussions.....

Hello one and all. I've been an observer of this list for a couple of weeks and feel it's about time to apply the humble introduction.

Basically, I have no formal wilderness training and have little to offer beyond the ENTHUSIASM of a kid, the THEORIES of many, and RESPECT for all

To be honest, I feel like a thief, sitting back enjoying the discussions and picking up some choice little tidbits. My only boast of outdoor knowledge is that I have learned many things from the Great Queen Mother Earth herself, who in my humble opinion has no mentor, nor competitor.

Hopefully I will be able to contribute something in return for the abundant harvest of information.

Anyone here built Tepees? Many aspects of them are quite appealing (to me) They are natural, functional, portable, comfortable.... I have a good story about shelters but will save it for later.

Thank you all for your posts and participation. And a special thanks to Andre for providing the Primitive-Skills-Group list info via the knapper. (seems that knapper traffic has fallen off greatly though, you agree? : )

*ff* Wisdom, like a web page, is always under construction *ff* :-)

I've heard of it being used to dress and pack wounds, although I can't say I've tried it. The Indegenous folks in this area used sphagnum to pack baby diapers. It absorbes moisture better than most sponges I've seen.

Another non-medicinal use is for insulating shelters. It's especially effective as an insulator after it's dry, though. I have found this to be extremely useful, especially in regions like mine where ground debri of any quality is scarce or non-existent at certain times of the year.

Well Dave, A Survival shelter that I can recommend is kinda difficult to explain. I'd have to draw it for you. But it's a round shelter, it's walls are stacked walls, with four poles going up in the center which surrounds the fire pit, Bracing the poles are beams tied around the top of the poles. Now. Put long poles all around on top of the stacked walls to for the roof leaving enough room for a smoke hole. Then put slabs of brark or whatever on top of the logs, and gather up a huge amount of leaves and brush and pile it on.

It should be twelve feet wide from the inside of the stacked wall to the

other inside side. (Say that five times fast:-))

My friends and I made one and has kept us warm whenever we camp out in it in the winter, and cool in summer.

Any question please feel free to ask!

Joe Schilling .'.

howdy primitives

Can anybody recommend a survival shelter that will provide protection from the elements, warmth, hold 6-8 persons and by assembled in a day. Would this be as simple as building one extra large debris hut? Ideally this shelter should be built in any season. I am looking for this shelter to be built in May. Looking forward to hearing these responses. Benjamin, great article on primitive cooking.

My opinion: For a group of this size, I would make a bark tipi or a bark hogan with a fire in the middle. I don't believe in debris huts (see next post).

I just don't believe in debris huts. Can someone try and convince me?

The theory behind a debris hut is that you create insulation around your body. The only insulating material in the world is trapped air. Granted, a debris hut will work in a nice dry environment with lots of debris which creat a lot of airspaces. Even so, it will take one person many hours to make even a moderately functional model. That's too long! Also, when wet, I'm sorry, but there is no air in water, and in my experience, a debris hut will only work if you make it while it is dry out and it doesn't start raining bad enough to soak it through. Once it is wet, it contains hardly any air, therefore no air space, therefore no insulation.

When it is wet and cold out, there is no way that I've ever been able to stay inside a soaking wet debris hut without freezing to death. Seems to me there are much better shelters available, and that staying dry is the absolute priority in survival.

Also, in real survival situations, you never have more than an half hour or so of daylight available.

Furthermore, moreover and in addition, what do you do when there is no debris, when there's just a bit of snow on the ground etc. Seems to me

My experience with the debris shelter is in 15 degree fahrenheit temperature with about 6 inches of snow accumulation. I know you Canadians and Rocky Mountain people laugh at that snow accumulation! Anyway, I tested this shelter under the conditions stated with jeans and a T-shirt and it performed very well. However, I agree with you, it took way too long to construct, took a lot of effort and would be my choice only if I could not do better and/or if there was plenty of debris to build it, easily accessible. I had about 24 inches of debris on the exterior and had the interior stuffed with dry leaves that I packed it full with and packed down 3 times before I crawled in. I have not tested this shelter in a down pour but I have heard that it does not shelter from rain, it soaks through. I would love to hear from some people's experience what their favorite emergency shelter is.

>

>snip!...

I'm a firm believer it making what fits the environment/location/weather/time/etc.and am not stuck on one design. I've had good luck with

debris

type huts (I prefer to call them squirrel nests) and variations on them, plus other types of shelters.

If the material is there, and the time, I'll make a debris hut. I have used very wet leaves once while in a downpour, and was soaking wet while making one, but when it was done and I crawled inside and took off my wet clothes, I was warm. It was above freezing for that one. I had mostly cotten on (jeans, t--shirt, wool sweater and a nylon jacket) The coldest I've been in one overnight was -10f. I didn't have the door well made and it leaked cold air the whole night, but I was able to sleep for most of the night, and make it warmer by the 2nd night. I was wearing wool pants/shirt/jacket/hat/mittens. I just used debris (the fluffiest dry leaves I can find, or grass and ferns) for inside, and stuff it completely so I have to jam myself in. It may take 5+ minutes to wiggle my way back in with the toes pointed.

They do take awhile to make, and I find that no matter how well I build it , it takes 2--3 nights before I am truly warm. After that it is only every few days that I have to add more debris, plus dry it out, etc. I'll also add bark to the outside when I have it thick enuff. The big tradeoff is that I don't have to waste energy gathering more wood to keep me warm all night in a bark shelter. I have also heated football sized rocks and brought in as a space heater (keeping it away from the debris!) for really cold nights, or when I wasn't able to make it as well as needed for the temperture. Also used heated rocks in thatched huts.

I have built them after dark, but it's much slower. Another method is to make a big leaf pile (or pine needle) and just crawl inside that. With

some bark and/or hemlock boughs on top, it'll stay pretty dry and get you thru the night in a pinch. I learned a good method of gathering the debris while I was a kid from watching my pet skunk. He used to "borrow" any clothes left lying on the floor, and would gather these up and take downstairs to his nest behind the dryer. He would gather up as much clothes as he could in his front paws, and then pull them backwards to his nest. I adapted this for debris gathering. I get down on all 4's, gather up as big of a pile in my arms, and then scooting backwards and raking them towards me, I can usually keep the pile the same size (if not bigger) by the time I get back to the shelter and then toss it on. also a forked stick as a rake helps alot and saves your fingers!

A way to increase the amount of trapped air is to alternate 6-8" of debris, 6-8" of small branches, more leaves, more branches, more leaves, etc. This also helps to make the bedris go farther. Just makes sure that all the holes are filled, and after a few days and a couple of rains, you'll need to patch it up. The last layer of leaves that I put on is about 1'+ and when I patch it up, just use debris after that.

if there is snow deep enuff for a snow tunnel, then I'll make one, or just jump into a snowback, enlarge a hole big enuff to sleep in, line the botton with a foot of boughs, and cover the top with limbs/boughs/bark etc. It's a bear making a debris hut with 6" of snow ontop of solid frost! When I was a kid we used to make a long fire and then rake it to one side, make a browse bed and sleep on the heated area with reflectors all around (see Hood's Woods www page for a better way of doing this).

I have also made thatched huts, but they take a while, so stopped trying to get one done the first day out. IF you find yourself lost where it's been logged, a log hogan/cabion may be doable quickly with bark/debris/mud/grasses to fill in the cracks. A Leanto with a fire and reflectors can also work.. Again, the more debris piled on, the better, both for holding in the heat and keeping dry. I'll make a browse bed and use debris for my blanket (or a thatched grass mett/sleeping bag). Also a small entrance opened out to a fire with a big reflector behind it and to the leanto to trap in the heat. sleeping long ways to the fire is warmer. always gotta pay attention to the fire once you start adding debris! thats when i'll switch to

rock heaters. I find my leanto's usually end up as a debris hut anyways (or my debris hut starts out looking like a leanto :--)

All in all, it comes down to location. If you have lots of firewood and little debris, it makes the choice for you.(and vice versa). I have been in more situations where I knew I could make a fireless shelter where my body heat does the work, versus getting a fire started for sure, and having to make that important first choice correctly, I'll usually go for a good thick squirrel nest over a fire.

>

After one is properly made, it will remain dry! I make mine with a min. of 3' of debris on the outside (4'+ for -20f and colder). Wet, dry, it doesn't matter much, just make it thick. I have been inside during flashfloods (6" rain over night) and stayed dried. If not made well, you will get wet. Some bark on top will also help keep it dry. I have one I made a few years back, and it still remains dry inside, even though I haven't done any maintaince on it for a year. I've slept in 20F dressed in just socks/jeans/wool shirt and been too hot. After taking off the wool shirt down to a

t-shirt, taking off socks and propping open the door a bit I slept very well. The key is finding the perfect location, since that is half the battle of making one. (or anything). They can't be made in all conditions, but what can?

What else are people making? I'm all for a better, faster shelter (these can take up to 1/2 day or more to make), and I have been known to sleep in a bush once or twice wishing I had a better shelter made :-)

>etc.

Ah, Debris huts. Well, I've slept in 'em many times with many different variations. Some simple, basic rules:

- 1)never sleep in one with your dog, or at least a dog that likes to kick your door in.
- 2)it usually takes a couple of nights to work out the kinks (i.e. find and fill all the nasty little draft holes, water pathways etc.)
- 3)there is usually always something that will work in a pinch if oak leaves or the equivilant aren't available, but there are exceptions as far as time of year and locations)
- 4)they can indeed keep you dry in a drenching rain storm and will keep you warm if you build it right.
- 5)it does take considerably more time to build a good one than 1/2 hour (although there are folks that claim it can be done in this time). Usually takes me about 3.

Other things that I have learned and tricks that help are:

Layering: If you are in an area where there is not a lot of good insulating material, a layers of sticks followed by smaller layers of what debris is available improves the

insulating capacity of the materials you do have.

Oak leaves or grass (preferably hollow stemmed) make the best insulation hands down! Followed by other types of hardwood leaves with pine needles taking a distant last place.

Other materials will work in a pinch. I have slept in a debris insulated with sphagnum moss and small layers of leaves, sticks and pine needles. I was warm with a light shirt on, but then the temp. never dipped to far below 60F that night. I did take the precaution of covering the moss with slabs of birch bark to alleviate the sponging (and thus drenching action). I stayed dry and warm through a drenching downpour that soaked other people in tents. Another material that probably would work as a supplemental material in a pinch would probably be dried cattail leaves. I personally have not tried this, though.

There are times when there is simply nothing available to insulate with, or at least very little. A stint spent in the Wind River Range in Wyoming required Wickiup type shelters and fires. There just was nothing but sparse grass and very sparse and small evergreen needles. We found ample supplies of dead, punky wood that seemed to work adequately for a Wickiup, but I just couldn't imagine trying a debris hut. Maybe if it was stuffed with live pine branches...although...it didn't look to inviting at the time.

Size is critical. Think very cozy sleeping bag, not tent. If you have an aversion to cramped spaces this is definitely not the shelter for you.

A good door is important in most instances. I keep my opening very small (just barely big enough to crawl in) and usually use a combination of a debris plug and a shirt or jacket if I have one.

My cold record is 21F with a light shirt and a sweat shirt on. Things were tolerable as long as my silly dog didn't knock my door plug in (she didn't care as the debris usually fell on top of her), however there were very irritating mini drafts that needed to be plugged.

I have never used debris that was already wet. I would imagine that using

the layering technique I described above you could create enough dead air space to keep you from freezing to death. I think I would try it if getting a friction fire going was out of the question, however if I had other options I can't imagine I wouldn't take them.

I have friends that claim they slept in these things naked in temperatures in the teens and were hot. One friend had a woven grass "sleeping bag" inside one at 20 degrees and had to come out he was so hot. He says he slept on the ground then with only the grass bag and was warm. I wasn't there to see it, so I can't verify it.

Well, that's my 2 cents. Other takers?

Mark

My vote goes to trash the debris, if for nothing other than comfort. Or I  
should  
say lack there of.

If you have enough time and dry material to make a good debris hut, you  
have enough time to build something better. I had one experience about 25  
years ago in what I call a debris hut.

The month was June. High temp about 70f F and low 45f F. About 12  
Boy Scouts went on a mini survival trip. Could not take food or matches.  
Could take a knife and sleeping bag. Of course all us MEN left the bags and  
brought only the knife. (being the prepared scout I was, I promptly smuggled  
in beef jerky and red licorice, boy, it never tasted so good!) Anyway, we  
paired up and built an elaborate leanto, 8 ft x 8 ft and 3 ft high. This we  
completely packed with dry leaves, mainly oak. Build time about three hrs.  
Come bedtime we retired to the hut and wormed in, short sleeves and all.  
My partner came completely unglued after about 2 minutes, where I myself  
could have probably stayed in the hut another 15 or 20 seconds, but there  
no hut left to stay in. All the little spiders and ticks took their toll.

We

exploded from the hut and were left with nothing but a scattered pile of sticks and leaves. Total destruction time: about 5 seconds. We hauled some of the bigger pieces of wood to the main fire pit and found every kid on the trip sitting by the fire already. We really didn't outlast them, we just built our hut pretty far from the fire pit.

Next day we built a small "dome" using mostly remnants from the first hut. We put leaves on Top and on the SIDES only. We cleared the floor of all debris and put down a layer of dry grass (foxtail type) about 10 inches thick. We actually got a couple hours sleep. Short sleeves didn't go well with the comfort factor.

Later in life I've built similar structures and camped in them down to 23 below zero. Of course I took the sleeping bag at that temp, but all things equal, the wigwam type shelter is far more comfortable (to me) and takes about the same time to build.

Dave I just drew this picture of a 6-7 person all season shelter. I was going to do it for my web page eventually, but your message got me motivated.

I apologize to those who dislike image attachments, this was the only way to show what this shelter looks like. You can load the image with any graphical Web Browser.

All Good Medicine,  
Marc Besse

The old saying where I live is "If you don't like the weather wait ten minutes". A friend and I where hiking on a long day hike in the Cascade mountains one spring day when a fast moving storm overtook us. We where 8 miles in and had now way of returning in the storm. The storm hit fast it brought 70mph winds with hail. We would have probably died of exposure if we tried to hike back in the storm. There is no way in hell we could have constructed a debris hut. I have found that in a survival situation sometimes it is just not feasible to construct these shelters in time. The solution was to find a stand of low growing Silver Fir and Cedar Trees. Round up as much debris and line the base of the trees with the debris and climb in. This makes an excellent first need survival shelter. The storm passed as quickly as it came and we decided to hike out before dark. Both my friend and I where prepared for wet weather, but you add the wind and

hail stones in and you have a dangerous combination. On our way out it was already getting dark and we came across a unprepared family stripped down to their underwear shivering around a fire the father had made. Their clothes where all completely soaked. This fire did not seem to help them much because the wind was stripping away all the heat from the fire. We attempted to give some helpful information to the man about some simple survival techniques. He was not interested in listening, the classic I know what I am doing syndrome. I always wonder to this day if the family made it out OK. My friend and I found shelter before we got soaked and hiked out toasty warm. We used very little energy to build our shelters and got in them quickly before the worst of the storm hit. Sometimes the simplest shelter can make a big difference. I think this type of shelter is often overlooked but they work well for me.

All Good Medicine,

True, I have made the quickie shelters along this line; find a good spruce (tight, fairly low branches, and nothing \*too\* unpleasant underneath), make a bed with more spruce branches and sleep more or less well for the night.

Another quick way to build a shelter is to build a structure out of whatever is available (usually dead wood and "second rate" -- the good stuff goes into the bed -- spruce boughs), and then covering it with moss (the kind that grows in thick mats on rocks, "armoured" with blueberry "bushes" [1]). This moss is virtually waterproof, at least I've have slept dry in some fairly good downpours.

If you have the time and inclination you can first cover the shelter with a thick layer of spruce boughs, and use the moss as a water- and windproofing shell.

I have slept well in such (unaugmented) shelters wearing a fairly thick wool shirt and hat at app. 40F/5C, no fire or hot rocks

On the question of debris huts; the only possible materials around here I have discovered is reeds and cattails, both of which pretty much requires getting wet to gather.

/Par

[1] Around here blueberry is a low (12-18") "bush" that grows just about everywhere in the pine forrests. As is lingonberry and some others, whose latin names I can't recall at the moment. All do a good job aromouring this moss until you can roll off thick blankets from the boulders, lug them to our shelter and roll them out; "instant shelter".

I am a real fan of the debris hut, but as was mentioned earlier, circumstances and area dictate the most suitable shelter. I stayed in a debris hut at TB's "back to back" for 2 weeks this past year when hurricane Bertha came through. I admit I had 1 small drip which was quickly and easily patched. Temperatures were not very cold, but the hut was very comfortable. Careful smudging helps to eliminate the presence of any previous residents :) I used the layering technique. Total construction time was only a couple of hours 2-3. In other circumstances where I would not be out long, or the weather fair, I doubt I would build one (applying the conservation of energy principle. I would seek alternative shelter suited to the terrain. Don't get me wrong, if I could be out for more than a day or 2, and the conditions were right ( no snow here in Texas to deal with ) then this would be my shelter of choice.

When teaching survival skills for the general public, I teach the debris hut as primary. It does a couple of important things for a "lost" person. 1. It anchors them to a specific area making them easier to find (hug a tree). 2. It helps psychologically since they can now "feel more secure". 3. It is easier to rely on for that extra measure of time to be "found" than relying on that person having practiced fire & shelter skills. 4. It is easy to remember what to do under stress.

The only experience I've had with debri type shelter was during a year we decided to camp without benefit of a tent. We stacked dead leaves into a platform large enough to support our sleeping bags. Then we piled more dead leaves on top of the sleeping bag leaving only the opening to wriggle into. Even though the night time temp dropped below freezing we were very warm. I think even a canvas, or blanket bag would have kept us warm under the same circumstances, Oh I almost forgot the old fashion army "rubberized" poncho we pegged over the whole mess to waterproof and wind proof the whole thing.

My experience with debris huts has been mixed. Personally I feel that the debris hut is over emphasized. The optimal time to complete one in fall is 1-1.5 hours by yourself. In september (when there are little leaves on the forest floor) it could take as many as 4 hours to make one. In general I have found that 3 feet of insulation on top off the shelter is sufficient for above freezing weather wearing a T-shirt and shorts. In freezing weather the thickness will easily go to 5-6 feet.

Another thing I will swear by it to stuff to inside to overflowing with leaves. This is the only way to provide enough internal insulation. A good door is essential also. I have gone overnight at 8 degrees celcius in a rainstrom with heavy winds in 1 foot of insulation in only a t-shirt and shorts. The wind ripped through the shelter but i did not get wet.

I can usually find dry insulating material underneath logs or thick piles of leaves. i always try to place dry material inside of the hut and wet material on top. Even if wet material is used inside, I have found that body temperature will usually dry it out a little. Of course in an evergreen forest one will have trouble finding enough debris to build a shelter. Green boughs can be used,

but you must double all thicknesses. In a pinch you can always stuff your clothes with leaves. This will usually help a little with insulation. I think the main aspect of the debris hut is not comfort but mainly to allow you to survive the night.

John,  
I have decided not to send along my entire treatise on shelters (16 pages, 20 photos), but I will inform the group when it gets published in a magazine. As for pit shelters with coal beds, here is the generic form:  
Dig a grave, long enough for your body, plus a foot or so extra, and deep enough so you can lay down, but can bend your knees without touching the ceiling (I like lots of roll-over room). Then dig down another 6-8 inches for the hot coal bed. Digging takes about 2 hours with a stick. Start a fire in the pit and burn hot for 1-3 hours, depending on soil moisture (burn time not included in total construction time). A hot

coal bed on the surface will produce steam when the dirt is put back on it, but in a pit shelter you can cover the coals with the now-dried dirt from the pit walls. The dirt puts out the coals, what you want is the hot mass of the ground. This covered, put a roof of sticks/logs across most of the top, except for a narrow doorway at one end. Cover the roof with debris to fill the cracks between the sticks, then cover with earth. Properly constructed you can sleep in shorts and a tee-shirt, without ever closing the door, down to about 20 degrees F. A coat draped over the hole is sufficient for a door if necessary. For successive nights, fill with debris (an underground debris hut), or make the pit extra wide and bring in a row of football sized hot rocks along one side.

There are unlimited variations on the pit shelter, hybrids with other shelters, some partially above ground, door at the end instead of straight up. Utilizing natural pits can significantly reduce the dig time. My favorite is to move into a pit created where a tree has fallen over, pulling a plug of earth out with it's roots. (This can only be done in damp weather, otherwise the fire may enter the roots of the tree and emerge days or weeks later.) Also herbs can be placed on the floor of a scout pit for a medicinal steaming.

A tip for debris-hutters with not enough debris: In dry soil build a hot coal bed in your hut site while you are gathering materials for the hut. In wet soil just bake the surface of the ground and sweep away the coals.

I had a nice campout this last weekend with my 6 and 7 year old daughters. We hiked up into the mountains and made a regular hot coal bed (with wool blankets) in the dry sand under an overhanging rock. The moonlight was beautiful.

These skills do leave impacts. Please think before you dig. Do not construct pit shelters in a green meadow. Instead use gravel bars along rivers (watch your water line!), or uncolonized soils below the forest canopy. You should not be able to tell you were ever there when you are done. Also remember that forest fires cost \$millions to extinguish. The bill goes to the person who starts them...

Always Peace,

Thomas J. Elpel

Debris do work, that is if they are constructed correctly. Yes it does take a little more time but I have slept in them in very cold weather...yes even in the rain. Making a grass matt to insulate you from the ground will help alot. time permitting of course. The shelter must be packed completely with leaves, grass's, ect. The heat from your body will dry the material close to your body and it will keep you from getting hyperthermia. I agree that they sometimes can be uncomfortable but they will keep you alive in a survival situation.

I haven't worked with the Super Leatherman yet, the earlier ones having left a bad taste in my mouth, however, I can say this for the SOG. Its blades are held in place by a tempered, bent piece of steel which is part of the grip. I have not had any problems with them flexing or sliding or unlocking, and if I did, I would simply take a file and pliers and carefully adjust the fit of the (easily modified) mechanism. To date, I've not had to do this, while using my SOG in the field on my car and around the office...AND using it at my workbench when someone swiped my needlenose. I give them a pretty rough workout, and they haven't needed replacement yet.

#### MY CAMPING KNIFE SET

When I was growing up, and even after I was grown, it was common knowledge among Western hunters and outdoorsmen that "a huntin' knife with a four-inch blade is dang well big enough." It was also well known that a man didn't need more than one knife for all his camping chores.

There was a touch of belligerence in those opinions. I think that we were reacting against any hint of flamboyance in our hunting gear, because we were the real Western manly types, and we didn't go huntin' except to lay in our winter meat, by #@&\*! No Hollywood showoff Bowie knives around our camps!

I lived and roughed it by that ethic for more years than I care to count. At the same time, I indulged a fancy for owning (not using!) various big and exotic kinds of knives. I collected or made quite a number.

Over the course of many years, as I hunted less (I don't hold with killing animals when you don't have to) but spent more time in the out-of-doors, I found increasing need for specialized cutting tools. Sometimes I was inconvenienced by having only a small belt-knife in my gear; sometimes I faced real emergencies. Gradually it began to soak into my skull that

- a) four-inch blades are NOT always enough, and
- b) you need more than one kind of knife when out in the wilderness.

The above is now common knowledge among outdoorsmen West, East, and everywhere else, and I suspect that a man who made a point of getting by with only one small knife would be considered kinda peculiar, even a bit of a showoff.

When you're at home, you can hoard tools to your heart's content, if not your wallet's, and it's not a bad idea to do so. Many a time I've faced a fixup or handycraft dilemma and exclaimed "If I ONLY had a pot-fid! WHY didn't I buy that scrimmag riffler when I had a chance?" Then I add one or two #@&\*!s and head for the hardware store.

But on a backpack or even a canoe trip, things are different. You can take only a minimum number of tools. Every ounce has to be justified. You must weigh the chances of needing a particular implement against the burden of lugging it wherever you go. You must face the fact that some things can't be improvised.

Experience has taught me to pack a basic set of four knives on wilderness trips. If I don't take all four, I face the possibility of needing one (badly) that I don't have. I seldom require a tool that these four don't supply. But these I need:

- 1) A Swiss army knife
- 2) A Finnish puukko
- 3) A Buck Special
- 4) A kukri

#### The Swiss Army Knife

This is cheating a little, because Swissies are small tool kits, not just knives. That's right, I'm cheating a little. When I first went camping with a Swiss army knife, I thought, What the heck, maybe this little thing will come in handy. At the end of the first four days, I'd used every implement on it, in earnest. Any make or model of Swiss army knife big enough to include scissors and tweezers is adequate. I can get along out in the woods without hobby saws or magnifying glasses, but I've got to have those awls, scissors, tweezers, and so forth.

Like any combination tool, the Swiss army knife is a compromise, but it's sturdy enough to answer most purposes. Also, those two small blades can be sharpened and honed to delicate razor edges and kept for fine work that bigger knives can't do.

Because it's often used to prepare food, and may have to do service in minor surgery, it's important to keep a Swiss army knife clean. I soak mine frequently, with all the blades open, in hot soapy water, finishing with a rinse in boiling water. Then I sun-dry it, still open, to discourage bacteria.

Needless to say, I carry my Switzer on a three-foot leather thong lanyard that never leaves my belt. That way, I always have my best tool close at hand.

#### The Finnish Puukko

Finnish what? "Small belt-knife" translates the word puukko nicely, and a nice little tool it is. The Finns and Lapps have been toting knives through the subarctic wilderness since before there was iron, and

they've worked out a nearly perfect pattern for a utility knife and scabbard. Mine is a slightly modernized version adapted for mass production by Tapio Wirkkala, the Finnish designer. It was made in two models by the Hackmann company, and sold well until, for some reason, it was discontinued in December of 1987. It has a three and one-quarter inch blade with a straight back. The cutting edge features a subtle combination of straight and curved portions which suit it to slicing, skinning, and chipping. If you can't get an example of this dandy little Hackmann, invest in one of the many similar puukkot imported from Finland.

The knife is carried in the full-length open-throat leather scabbard characteristic of Finnish knives -- even Wirkkala couldn't improve on that design, except to substitute a hardened nylon liner for the traditional bone. The beauty of this type of scabbard is in its simplicity: no keeper to fumble with, just drop your knife in when you're done with it. Because the handle of the knife and the mouth of the scabbard have matching tapers (always design your knife and scabbard as a unit), gravity is enough to seat the knife securely; mine has never dropped out. The scabbard originally came with a twisted thong belt-loop. Time and use eventually wore that away, and I replaced it with a foot of leather thong, one end tied firmly to the scabbard and the other end knotted in a loop. When I need my puukko with me, I simply slip the loop down through my belt, pass the scabbard through the loop, tug the thong tight, and thar she be.

Like all old-time Westerners (and Finns), I carry my knife behind my right hip with the scabbard tucked in the pocket of my jeans. This is far and away the safest place to wear a knife. When I want to use the knife, I start it out of the scabbard with thumb and forefinger; many puukkot even have a German silver horsehead on the pommel to assist in drawing it this way.

I must do fifty percent of my camp chores with my lovely little Finnish belt-knife.

#### The Buck Special

Everybody wants to own a Buck knife. Everybody should. Buck makes just about the best line of folding and belt knives in the U.S., if not the world. However, I've always found one fault with most of their models: the handles are too small in diameter. This is the weakness of practically all American hunting knives of the older generation, and was my father's chief complaint about the Marble, Western, and other brands we carried -- that and the cheapness of the scabbards.

Wellsir, Buck has fixed all that. Their Special has a six-inch blade and a generous,

gently finger-notched handle that together suit it to just about any job a medium-sized knife can do. The thick spine of the blade gives plenty of strength, especially for woodworking, while the deeply hollow-ground edge cuts efficiently and can be sharpened to a keenness that does your heart good.

Because I'm picky, I'm not entirely satisfied with the shape of the Special's blade: the last two inches of the edge curve steeply upward to an almost flamboyantly raised point. Mr. Buck no doubt intends this for skinning; well, maybe you could use it for that in a pinch, but as you and I know, a skinning knife is a specialized tool, and needn't find a place in your gear if you're not going hunting. If the point was located nearer the centerline of the blade, this would be a handier knife for certain kinds of fine work; but I'm not yet ready to hold a \$40 dollar knife against a grindstone, so I'll continue to use it as is.

The guard of the Special is just big enough to prevent your hand from slipping onto the blade, and not so big as to interfere with your work. The handle is made of that lovely black synthetic that Buck has used for many years. This can get slippery in use, but because the handle is fairly large and well-contoured, you won't lose control.

The scabbard is a heavy leather proposition with a big snap keeper. The bead or cut-strip is made of a rubbery synthetic. Because the blade of the knife flares slightly at the beginning of the curve, there's a pronounced hangup at the mouth of the scabbard just before the knife is fully drawn; it takes a deliberate effort to pull the Special all the way out, or to resheath it. This is a dandy safety feature and I'm all for it, but it makes this an awkward knife to carry behind your hip. For that reason, I usually haul my Buck in my gear rather than carry it around on my belt.

Perhaps someday I'll 1) modify the blade and 2) build a full-length throated scabbard for it; the pommel is the familiar single-lobed shape that would suit the knife perfectly for drawing from a Finnish-style sheath.

Take care of a Buck knife and your great-grandchildren will still be using it.

The Kukri

What in the Sam Hill is a feller from Wyoming doing with a chopper from Nepal? Answer: using it to clear brush, cut grass, freshen blazes, trim poles, gather fir tips for bedding, fell good-sized trees if necessary, and do a lot of other things that an ordinary slasher will do only half as well. I've even been known to turn it over and drive tent pegs with the back of the blade, an unwise procedure with most knives, but one

that's never damaged any of my kukris one bit.

A good kukri is much safer and more efficient than a hatchet, and smaller and more versatile than a machete. It's no accident that the British Army and the RAF issue kukris for jungle service.

I'll admit that I first tried one because I'm partial to exotic blades, but now a kukri seems as homey as a coffee-pot on my camping trips, and almost as vital.

Some knife-makers in the U.S. currently offer their idea of a kukri for sale, and while these may be good designs, the price is wrong. Indian-made kukris are available at modest cost from mail order outlets in this country, or you can send one dollar to the folks at Doon Steelworks in Dehradun, India (that's all the address you need; the Indian Postal Service is wider awake than ours) and receive their catalog. It lists several models of kukri for staggeringly low prices.

Doon may still be able to offer you a World War One-era Indian Army surplus kukri. If so, order two, one to hang on the wall as an antique, the other to polish up and carry on wilderness journeys. These are big kukris with thirteen-inch blades, the best ones can be beautifully balanced and finely ground; after seventy-odd years, the edges are still keen. Equally important, the hardwood handles are large and well proportioned. They did these things right, in the days of the Raj.

Alternatively, my choice for a packing kukri is the ordinary modern enlisted man's model, preferably with a wooden rather than a horn handle. This is a hefty enough knife for almost any job: a foot long in the blade and over a pound in weight.

The heavy-duty imported kukris frequently offered in this country are a bit too bulky for my arm, and the edges are not ground for efficient cutting. If you acquire one of these, consider regrinding the blade to remove a LOT of metal. Be prepared also to reshape the handle, since these are often crude and over-large. In the main, the modern Indian-made heavy-duty kukri gives the impression of being more raw material than finished knife.

I carry my kukri lashed to my pack, never on my belt; the scabbards are light but bulky, and too much trouble to wear. (They look a tad Hollywoody, too.) In camp, the sheathed kukri can stay with my pack or travel with me when I walk into the timber to cut a pole. For safety, I keep that heavy, sharp blade sheathed unless I'm actually swinging it.

The handle of the modern enlisted man's kukri is a bit small in diameter (that old shortcoming!) and may

tire your hand and/or become slippery with extended use. A good trick in this case is to wrap the handle with a strip of towel. This will increase the diameter for better control, cushion your hand against shock, and soak up sweat without growing slick.

#### Besides Those Knives

When I was a boy, we all learned this lesson early: A dull knife is no knife at all. During hunting season, every male in Big Horn, Wyoming sported a shaven left forearm from testing the edge of his knife, except my father, who was left-handed and therefore kept his north forearm smooth.

If I'm travelling farther than the mouth of the driveway, I take a pocket carborundum stone with me. This is very light and very small, and many people would find it inadequate for keeping blades sharp on a hiking trip. After a lifetime of use, I've learned to make do with these little stones by using them frequently to touch up an edge, rather than for heavy-duty sharpening of a badly dulled knife. In other words, I've learned that I have to maintain my cutting tools.

The same kind of attention should be given to your scabbards, since a knife and its sheath are in fact a unit. Examine your scabbards frequently, looking for wear and damage. Dress the leather the way you'd dress your boots. Give particular attention to your scabbard's security; if it doesn't seem capable of keeping your knife snugly at home, improvise or make repairs on the spot. If your knife-sheath lacks an efficient keeper, don't hesitate to tie the knife in place with twine or thong; it's better to put up with a little inconvenience of this sort than to reach for a blade that's lying on the ground miles down the trail.

But don't overdo the quest for security with your belt-knives. A lanyard for this type of tool is a bad idea, first because it constantly gets in the way of your work, and second because, if a tethered knife slips out of your hand or scabbard, it at once becomes a swinging, whirling lethal menace.

A wrist-loop, however, can be very handy, because it allows you to release your knife without having to put it down -- a labor-saving wrinkle when you're cleaning fish or cooking. But don't carry your belt-knife in an exposed scabbard with the wrist-loop attached. Sooner or later, a branch will get caught in the loop and hook the knife right out of the scabbard, and you'll walk off and leave it dangling in the wind, perhaps in the middle of a tangle of chokecherry bushes where Jim Bridger himself could never find it.

With the four tools described above, I'm equipped with a suite of small implements including two delicate

blades for fine tasks, a handy light knife for the majority of chores, a robust medium blade for rough jobs, and a powerful whacker to deal with the drastic stuff. I know that these aren't enough to deal with Mom Nature's ultimate tricks; nothing man-made can do that; but I feel ready to face the old girl with a smile and a few tricks of my own.

Yes, your last message cleared that up. I guess I took you wrong on your use of the word 'convince' and I may have been a little tense because I read those notes after your personal note about your name. I hope you got my response to your note before this one. I guess I took 'convince' as a little over inflated ego (I can't stand that kind of person! A good

teacher is also a good student, in my book.), sorry I took it wrong. Thanks for sending the note to me personally. I'm glad you asked though, many people would not bother to check, when most disagreements could be settled if people were just straight and honest with each other in a respectful way. I say only good things about you. Peace my friend.

As Ron points out you can do yourself some serious damage with this stuff (as is possible with knives, axes, slings, etc). But used properly (fraction of a teaspoon of KMnO4 [1] and sugar mixed dry as powders, used in the open, not in a container) it is a harmless firestarting booster. Anything else is evolution in action.

> It is extremely sensitive to detonation and may even self-detonate.

Not as mixed crystals, made up on the spot. Then it is highly combustive, not explosive.

> Just thought you should know. I suggest we avoid discussing explosives. Sam  
> is soooo paranoid.

Slinging handgrenades does \*not\* upset your uncle?

/P"r

[1] The lower case "n" is important; it is potassium, manganese (Mn) and oxygen (O). If email supported it the 4 should be a subscript.

All first aid organizations (St Johns Ambulance, Red Cross etc) recommend carrying a pair of rubber gloves to protect oneself against infectious diseases when treating casualties.

They also make good water carriers (as do condoms) or emergency pee-buckets for that late night urination when it's 40 below and you don't want to leave the warmth of your shelter, or in the case of a laid up casualty, when they can't leave the shelter.

In an emergency they make good, surprisingly strong lashing. Hey, and maybe you could even make a sling out of them :-)

Subject: Survival Kits

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

Status: U

X-Mozilla-Status: 0001

Here is an interesting thread to get started, I hope. What would you or do you put in a survival kit? In my book, there are three survival kits a really prepared person should have, one for the side on a belt or

otherwise attached to you in case you lose all your other gear, one for the trunk of your vehicle with enough basic supplies for 2 people and one for the home. Obviously, one would allow for more 'luxuries' than the other, respectively. So, anyone interested in contributing to this thread please specify which kit you are contributing to. I would like to see us start with the first one, the pocket survival kit (This kit would be limited to basic items that could fit in a container no larger than an average fanny pack, preferably smaller). I will also sometime in the near future provide my list as well as the list of a couple of other people I know that was sent to me by a friend of mine who sent out a questionnaire to some pretty experienced and skilled individuals. Let's don't be afraid to critique some of the items people name, ask for explanation or suggest a substitute item (be nice). I for one will be compiling a list of input from all of our experience. I know Andre will also keep a file stored for our index.

Speaking of Andre. I really tripped out on this guy one day at a restaurant (and at the same time was very impressed), here in Charlotte, NC, as he and another friend got talking about survival items they had on them. I think Andre won. I was amazed at how many useful items he had in his billfold alone! So, I'm looking forward to Andre's input on this thread, and all of you!

You can go on forever on this one. Many lists have been circulated on the usenet over the years. I have a collection of them (lists that is). Much overlap is to be expected, but you can get a good statistical view of what most people consider most important by sorting items by their appearance in multiple lists.

When I put together a kit, I think food, water, shelter, clothing, fire, and communications. In theory (for me), the kit should be completely self-sufficient. That is, you shouldn't have to pick up \*anything\* from your environment. Though in practice, this is not usually the case, you can get pretty close.

Let me start at level ONE. I am very interested in what Andre has in his wallet. I have no survival gear in my wallet although there is usually enough paper in there (not money) to make decent kindling.

I usually wear a hat. One of my hats has a pocket in it, and in others I make a pocket in a sweat band. In the pocket, I carry one of those little credit card tool kits. There is a magnifying lense (fire), and a working if simple compass, knife, and a few other things. It isn't very good, except for the knife, but it is convenient. If I don't have one of those hats, I can put the thing in my wallet.

I always carry my keys. On my key-chain there is a small SAK, a screwdriver (flat and phillips), and a magnesium block fire starter with an integral sparking rod. In some other pocket, I'm almost always carrying a folding knife with a 2.75 to 3.5 inch blade, one of those clip-ons that opens with one hand.

So before I pick up anything else, I have 3 knives, a fire starter, and a few other odds and ends. I usually wear pants with cargo pockets, and into these (if I go for a walk in the woods), I will toss 50 feet of parachute cord, electrical tape, sometimes my folding slingshot and a film can filled with 1/2" ball bearings, along with a few granola bars, and one or two of those mylar survival-rescue blankets.

The next level up I will cover in another post. I can go one of two ways, or both. I have a day-pack style jump kit always at the ready. I also have a vest with lots of pockets into which I can stuff just about everything I usually keep in the pack, making room for lots more stuff in the pack. I

will detail this later...

My minimalist survival kit is a Victorinox Swiss Army knife (hunter model with saw) in the official knife case. The case is a little larger than the knife so that a Doan magnesium firestarter just exactly fits in along side the knife. I then put a small hole in the case and string a chain through it and the hole in the firestarter so it won't get lost when the knife is in use.

In general I agree on your 3 levels of classification. In practice I tend  
to subdivide the first class into two categories, the  
"don't-leave-home-without-it" and the pocket kit. The pocket kit does take

up space (fits - barely - in a jeans pocket, but I tend to fill my pockets fairly well anyway), so it gets left at home much of the time on a day to day basis.

Don't-leave-home-without-it:

Swiss army knife  
Doan type magneisum/sparker steel  
Silva "SERE" button compass  
Cord (5-6 feet thin and strong cord)  
Waxed paper (sold as charcoal lighters, works like birchbark)  
Band-aids  
Sharpener (usually)

Pocket kit (a leather roll up case):

Knife (small lockback knife)  
Doan type magneisum/sparker steel  
Silva "SERE" button compass  
Cord (10 feet thin and strong cord)  
Waxed paper (sold as charcoal lighters, works like birchbark)  
Band-aids  
Butterfly closures  
KMnO4 (potassium permanganate)  
Small "Cycalume" staff (the app. 1" version)  
Water putification tabs (5-6)  
Plastic bag (freezer baggie 2 qt type)  
Adhesive repair tape  
Wire saw (better than nothing...)  
3 snares (home made, rabbits, birds, etc)  
Matches (waterproofed)  
Al foil (so so mirror for signaling, fishing lures, etc)

I believe it is \$4.95. The best 5 bucks you can spend on survival equipment.

Also, you can check out Brigade Quartermasters at [www.brigade.com](http://www.brigade.com)

> So much talk lately on these magnesium fire starters. --  
> Could folks post their approximate cost and sources?  
> Would help one and all .

Hi Don

A magnesium firestarter is the first thing in my pocket whenever I leave the house. I carry matches and a BIC lighter as well, but these things tend to fail at the wrong time (when you're wet and cold).

The mag firestarter works even when wet (you just dry it off!) and is so reliable and simple that even a criminally inept fire maker like me can use it.

They cost about \$8, weigh nothing and are about 1 inch by 2.5 inches by .2 inch in size. You can pick them up at most outdoor stores.

I can make sparks using a knife/axe and a hard rock if I have the right conditions (you know - indoors), but nothing beats the mag for reliability.

The key though is to know how to use it. Banging away at the thing making pretty sparks does you no good if you don't have tinder to catch them. The best two tinders I've been shown (and use frequently) are Old man's beard (also known as witches hair) a type of lichen found on evergreen trees, and, even better, shaved resin soaked wood. I shave the wood into a fluffy ball of resinous wood. One strike of the mag firestarter works 3 out of five times.

The old mans beard only works when it's dry, so this is one of my favorite summer tinders. The resin wood works all the time. I was taught two ways to find dry resin soaked wood - even if it's rained for a week - firstly, a naturally dead evergreen stump (naturally dead as opposed to having been hacked down by a logger). When a tree dies, its "blood" drains down to its base. As the tree rots and eventually topples, you're left with a punky stump that is just dripping resin.

The second place (one that I prefer to avoid because it scars the tree) is a cat-face. This is a part of a living tree that has been damaged such that the wood shows through the bark. To protect its injury, the tree creates a "scab" of resin over the wound. With a sharp knife and a baton it's very easy to shave off a two to three inch piece of the wood in the cat-face.

BTW except when I'm feeling lazy or it's very wet out, I rarely use the magnesium part of the firestarter - just the flint. I don't often find I need the "boost" given by the burning metal. (it burns WHITE hot).

Regards

Kevin

I'm similarly interested in this thread. Here's my fanny pack one:

This fanny pack is no larger than the usual fanny pack, but has one added feature I really like: the top unzips to pull out a full-sized upper compartment complete with straps, thus creating an emergency knapsack with the fanny pack as a bottom, zippered compartment. I got one by happenstance, and have regretted ever since not getting one or two more.

The contents:

compass  
three slings (unless my kids have swiped one again;-)  
two D carabiners  
one other carabiner, not a D  
an 8 (you know, that piece of rappelling gear shaped like an 8  
with a larger O on the bottom, useful for belays)  
two 25' lengths of parachute cord, with the strings in the middle  
a webbing loop, big enough to be usable as a swami seat if necessary  
a Fisherman's Swiss Army knife  
salt tabs  
aspirin  
rubber gloves  
a knife with fork and spoon built in (sentimental)  
sewing kit  
bouillion cubes in an empty film canister  
H2O proof match tube with strike anywhere matches plus striker  
small first-aid kit (bandages, gauze, ointment, tape)

Hmmmmmm. I know there's a couple other thngs, I'll have to go empty it out completely. I've never dug in all the way since I first put it together!

Bill B.

Not sure if it was you, but someone wanted to include KMNO4, I was wondering why and what is it used for?

X-Mozilla-Status: 0011

Just remembered some more things in my fannypack one:

survival "space" blanket  
firestarter, custom made  
coupla baggies  
TP

Something else triggered this recollection. The firestarter is one that you should be able to get most anywhere, probably for free. Go to any dental lab that makes dentures and ask them if they'd mind saving the squeezed out excess materials from when they cure them. What they do is they mix up this acrylic-like material out of powder and liquid, put it in the cavity, close up the flask, put them in a vise, and squeeze the vise shut. As it shuts, it closes up the flask tighter and tighter, thus squeezing out the excess material. They then trim off this stuff and toss it. My dad used to cut this off and roll it up like kids do with clay, making a rough cylinder about 1/2" to 3/4" diameter in the thickest part, about 3" to 4" long. They stink, but they light readily and burn slowly. This coupled with a good spark and some light tinder should give one plenty of time to start up a fire. If they don't want to roll it up, then just ask them to dump it in a bag instead of in the trash, no problem. Don't let them boil it with the flasks, you want the material before it's cured by boiling, just air-cured.

If worse comes to worse, swipe someone's dentures after the plane crash or whatever. (All you maggot eaters out there, be warned. Nothing, and I mean NOTHING will prepare you for the disgust that will churn your stomach if you get a really, really dirty denture! Shudder!)

Bill B.

Posting this to the list in case anyone else is also confused about this item in my kit:

> Rubber gloves?

Yep, Phil, rubber gloves. No, not for rectal exams. They make great emergency cold-weather protection for your hands. They seal in the heat that would otherwise be lost thru thin gloves or fingered gloves by providing a heat barrier between your hand and the outside sock, glove, or whatever. I pack rubber as they'll be re-useable, but you could also use those plastic gloves such as come in women's perm or hair coloring kits.

Nope, it was me.

Multiple uses:

- \* Firelighting. If I happen to have sugar available somehow (mix some up, and it will ignite very easily)
- \* Water purification. Mix one or two crystals with 1 qt of water. Probably not the best way (healthwise) in the long run, but if I truly don't trust the water and can't cook it for some reason...
- \* Disinfectant. Add a bit more to the water. Will turn your skin a beautiful purple color...

\* Supposedly you can make signals with it; make a strong solution and spread it on snow.

\* Stain everything I own purple :-)

/Par

KMN04 is used in the Medical field to cure Athlete Foot and other fungal infections. I have also been told when mixed with other Chemicals, it will also make things go BOOM! I found all this out yesterday from a friend of mine. Hope it will be of some help to all of you.

Gary

A small pile of KMNO4 will ignite with a few drops of antifreeze from your  
car's radiator.

Potassium permanganate (KMnO<sub>4</sub>) can also sterilize water. Add enough so  
the water turns very light pink.

I don't know of any web sites but I will be glad to mail you some  
really great info. Just help me cover my costs. \$7.00 (If you're in the  
U.S.)ought to do it. Write my snail mail below. I'll send you my book  
and some info on Paul Dinsmore's wet scrape, smoke before braining  
method.

I also recommend the following books:

Blue Mountain Buckskin by Jim Riggs

Braintan Buckskin by John & Geri McPherson

Braintanning, The Sioux Way by Larry Belltz

Hi Gerry,

Point your Web browser to this webpage and you will get some great information on Tanning that hide you have. Some of the best Tanning information I have seen on the Web. Here is the URL <http://www.lib.uconn.edu/NativeTech/tanning/tanning.html> It is about TANNING THE INFIRM WAY A Description of the Pre-smoking Method of Brain Tanning by Paul and Snowbird Little Spear. I hope you will enjoy this information as I did and it works great. Give it a try.

Merry Christmas and a Chippin New Year!

Gary

Paul Dinsmore came out to the East coast for us and did a class for us here at TRIBE on the pre-smoke method used by the Northwest Coastal primitive people. His method is very effective and comparable to other methods of braintanning. He had some excellent tips for speeding up production also. He also sells braintan cheper than anyone I have ever seen: \$10 per sq.ft. or 7 fully scraped hides for one finished hide. I don't know if he still offers that deal. But if anyone ever needs his address, let me know. Paul is a good guy to know and a good resource. I don't want to get into a big braintan thing on this list since it isn't about braintanning. But if anyone is interested e-mail me personally and I can furnish information and/or answer questions for you on braintan. There was a great write-up in the latest issue of the Bulletin of Primitive Technology, by the way. ---Benjamin Pressley (benjamin@perigee.net)

Do you have to do anything to the hides to remove the salt before beginning? I have never tanned before but am interested in starting.

Thanks

Hose them off well and even soak them for a couple of hours. They will respond just fine to the rest of the process.

In the name of the primitive skills group, a warm welcome is issued to Mr. and Mrs. Veilleux of Ottawa who just joined us. Happy to have you aboard!

veilleux@NETCOM.CA wrote:

>

> My husband and I, as well as some friends, are presently brain tanning some deer and beaver hides. Any tips on sources for hides would also be appreciated.

I think the very best source for hides is your local small time butcher. Try to find out who butchers moose or deer during hunting season for hunters. They will sell you all the hides you want. Going price in Chicoutimi is \$5 for a moose quarter. I put an add in the Chicoutimi

paper asking hunters to call me if they had a hide instead of throwing it away, and I received so many calls that I ended up with 90 free moose hides! I've still got many nailed up to my barn walls awaiting to be transformed into useful items.

For furs such as beaver, wolf or any other so called fur bearer, fur auctions are your best bet. There are some in your area. Call "L'association des trappeurs du QuÈbec" for the dates, which are coming up soon, usually in late February. I got bear skins for 10\$ last year. Often, you can get skins that are damaged at a very very low cost.

Subject: Hide tanning "cold scrape"

Content-Transfer-Encoding: 8bit

X-MIME-Autoconverted: from quoted-printable to 8bit by chic1.saglac.qc.ca id KAA06109

Content-Type: text/plain; charset=iso-8859-1

X-Mozilla-Status: 0001

To add to Ben's dry scrape post and Tom's wet scrape post, here's this  
from the north: cold scrape.

Here, my indian friends would never even think of any other way of  
scraping and preparing a hide. After cutting off the hair as in the wet  
scrape method, the basic process is to get the skin good and wet,  
stretch real tight and put it outside at a temperature of -20 degrees  
Celsius or colder. Then a scraper (usually an axe head to which is  
attached a long perpendicular handle) is used to pull off scrapes of  
skin which look a little bit like very thin wood shavings coming off  
with a hand plane or spoke shave.

This process is repeated until the skin is of uniform thickness  
everywhere. The rest of the process resembles the wet scrape method.

The following video documents the entire process very accurately. You should be able to obtain it from the University of QuÈbec through inter-library loan if you can't find it elsewhere.

AUTEURS(S): +The Trust for native american cultures and crafts, prod  
Vaillancourt, Henri, real Todd, Crocker, cped  
TITRE(S): \*Indian hide tanning  
EDITION: Greenville, N.H. : The Trust for native american cultures and  
crafts, c1981.  
COLLATION: 35 min : son., coul.  
NOTE(S): . - Offert sur videocassette 1/2 po (VHS)  
TYPE DE DOCUMENT: Videocassette VHS

Hope this helps,

AndrÈ

Man, I'm glad you shared that. I always wondered how they did hides in the frozen climates. Boreal skills is definitely an area I mean to learn more about one day. I don't have anything but book knowledge on that subject.

Benjamin Pressley

-----  
Hi,

The three publications listed by Benjamin Pressley cover  
"dry-scrape" brain-tanning. If you are interested in "wet-scrape", we sell  
the video "Tanning Spirit" by Melvin Beattie for \$40 (includes postage).

Dry-scrape typically uses a sharp blade to dehair the hide while it  
is stretched tight in a rack. The hide is usually stretched soft in the  
rack also. Wet-scrape uses a dull blade to dehair the hide while it is  
draped over a beam. Wet-scraped hides are usually pulled soft (kind of  
like pulling taffy), and the hides are not put in a rack at all.

Dry-scrapers and Wet-scrapers don't necessarily see eye-to-eye. Each camp  
tends to think theirs is the better way. You will have to decide that for  
yourself.

I have written extensively on wet-scrape in my Field Guide to  
Primitive Living Skills, available for \$20 (includes postage). Most of the  
hide-tanning section appeared as a two part article in BackHome magazine  
last year. A new book is out by Steve Edholm and Tamara Wilder (also  
wet-scrape), which is supposed to be excellent, but I do not currently have  
the name of the book, or their address.

You can reach me at:

Thank you for the distinction. When two groups disagree like this, it usually means that each technique has some advantages, and some drawbacks, possibly under different conditions (weather?), or when different skill levels are involved, time constraints, characteristics of the resulting hide, etc. I assume you and others understand both techniques and perhaps would be willing to discuss the trade-offs.

I am also interested in what you do with the hide *after* the hair is removed. This is not the end of the tanning process is it?

-----

I for one have come to peace with both worlds and don't get in arguments about it. As you say, there are advantages and disadvantages to both. Doing dry scrape requires very sharp tools and requires near perfect conditions as far as humidity. The hide has to get dry before it can be wet scraped. It has been theorized by some that dry scrape may have just been used for thinning a hide. Most hide tanners I know that do a lot of hides every year will tell you that the dry scrape method produces a softer hide. I, myself, notice a slight difference, but mainly when I smoke a hide before braining. The hide does not seem to break as soft when you smoke first. I hope I'm not setting up for an argument on this, I'm sure it can be debated.

Maybe, I'll just avoid the controversial stuff and stick with the advantages I have found in both methods. I use both, interchangeably. The thing I like best about wetscrape is that everything can be done on the fleshing beam (fleshing, scraping). You don't have to punch holes around the perimeter of the hide, you don't have to string up the hide and stretch it out, re-tighten and re-tighten, etc., etc. You can also use dull tools on wetscrape, no constant tool sharpening. If you use a beam like Paul Dinsmore uses made from various diameters of PVC pipe you can vary the surface to accomodate stubborn areas. You can use a dull draw knife or a bar mounted with handles on each end. Now, I'm not just trying to sell wet scrape here. When I teach students I start them out learning dry scrape. Dry scrape allows you to study the hide a little closer so you see everything that needs to be removed. You don't miss as much as you do when you wet scrape.

You also asked what follows de-hairing. Whether wet or dry scrape you have to remove a layer of epidermis on both sides. If you have a good fleshing tool, if your stretching the hide in a rack (a la dry scrape) it can remove this epidermis or scarf skin during the fleshing process. That's the flesh side. On the hair side there is also a layer of

epidermis to be removed. It is best to do this right the first time, for left over epidermis, particularly on the hair side, hinders good brain penetration and is very unsightly (nothing more embarrassing than someone coming up and stripping some left over epidermis off your just finished shirt leaving a white spot under the smoked hide. Of course, that never happened to me. Hah!).

After thoroughly fleshing, de-hairing and scraping, the hide is ready to be brained. I mix my brains in a blender because the more thoroughly liquidated the more efficient the tanning solution. You can just mash them up by hand, though. It is also a good idea to mix them in warm water. Some people prefer actually 'cooking' them in the water, just don't boil them or actually cook them. Use just enough water to cover the hide. Now, Paul Dinsmore has illustrated to us that you can actually use one pound of brain to 5 gallons of water if you pre-smoke. The smoke is like an enzyme that strips the glues from the hide therefore allowing more efficient penetration of the brains. There are also many other methods of stripping these glues. There is an excellent article on this in the latest Bulletin of Primitive Technology.

You then soak the hide in the brains about 15 minutes, working and wringing the hide in the solution. You then take the hide out and thoroughly wring it out using a fence rail and a stick or whatever works. Wringing is very important to good brain penetration. Soak and wring several times within an hour. It shouldn't take longer than this for a good braining. You can tell when you have good brain penetration when you can stretch the hide on any part of the hide in any direction and it stretches 2-3 inches. The brains also bleach the hide out white and it is also at this time that any left over epidermis will show up yellowish and any missed hair follicles will look like pepper all over the hide.

Now, what really gets that hide soft? Breaking it. You can hang it up a short while depending on how dry it is. Don't hang it in the sun, though and don't let it dry out completely anywhere. Dry spots will be hard spots. When it is still real damp it is time to pull it (break it). You have to keep that hide moving till it is completely dry. If you don't have time to stay with it, then bag it up and put it in the freezer. Some people do this anyway, the expanding ice helps to break it. If you do this, don't let it completely thaw shake the ice out of

it. It freeze dries it, gets a lot of the water out. Don't worry the brains have did their work, if you did a good job braining it. The way I like to break it is across my knees while sitting. Just put your knees together, stretch the hide over your knees, then spread your legs while keeping the hide tight across your legs, stretching the hide as your legs spread apart. Keep moving the hide around in circles and doing thid till completely dry.

The hide must be protected from getting wet at this point or it will harden up and have to be re-brained. To waterproof the hide...before I go any farther I should explain that term, waterproof. Water proof in this context does not mean water repellent, it means it will keep it from getting hard spots when wet. To waterproof the hide you must smoke it. Just get a good bed of coals laid in a pit and then throw rotten, punky wood on it and keep the flames smothered out. This can be done in a smokehouse (just throw a metal plate over the pit) or smoke can piped up through the hide by a series of pipes proceeding from something like a trash can that is smothering out the flames. The series of pipes being a stovepipe, followed by a tube of canvas, followed by a tube formed from the hide itself and suspended over a limb to hold it all up. There are also wilderness, primitive methods of doing this, I'll be glad to discuss. The hide does have to be smoked on both sides thoroughly. You can smoke it as long as you want to get it as dark as you want provided you keep it from getting too much heat. It is animal organic material like meat and will cook and be ruined as far as usefulness as material. Smoking also insect proofs the hide and bacteria proofs it. You can wear a shirt made from smoked hide and sweat all you want and it will never retain a body odor! This is also useful in hiding your body odor when hunting.

I know this was lengthy but there is no short answer to this question. The best way is to learn it from someone. I can probably recommend someone in your area, just let me know what your area is. I will be conducting a class in Charlotte, NC to anyone interested April 4-6, if anyone is interested. The class is filling up fast, though. I would also be glad to mail a bunch of information on both methods for anyone intersted, including the Dinsmore method of smoking before braining and sketches of his fleshing beam. Also included will be my book on dry scrape. I would appreciate \$10 to cover the costs, though

(that is in the U.S. Anyone else inquire). Just write me at my snail mail below. Hope this helps! If you have any specific questions let me know.

Hi Bill,

Making rawhide means just what the word says: Raw Hide. This means you don't do anything to it!

Just scrape off every little bit of meat on the flesh side on a fleshing beam or other standard ways.

Then cut off the hair, and when it's short, scrape it off with a sharp scraper. Lots of work, this part. Now you have rawhide.

Bernard Mason, in the book Camping & woodcraft, states that "Salt ruins it for rawhide". Preserve your skin by drying or by freezing. I dry mine by nailing them to the barn walls. Once dry, they last for years, and when I need a piece fo rawhide, for example for tying my dogsled

Subject: Making Rawhide

Content-Type: text

Status: U

X-Mozilla-Status: 0001

Halp!! I'm kind of in a hurry to gather this info, so turning here first.

It looks like I'll have a recently skinned cowhide coming in. I'd like to tan it, no problem there, but I have a need for some rawhide. I'm not sure how to go the rawhide route as opposed to a fully tanned hide with the hair still on (or off as the case may be).

At what point do I depart from standard tanning methods? (no brains (um, I know that's risky to say, but I mean not using brains in the tanning solution...awwww you know what I mean!;-))

What do I do different to get a good piece of rawhide out of the hide? (I'm looking to use it for some projects such as making a bodhran (a type of frame drum))

End use is envisioned as follows, taking advantage of rawhide's structure: wet, pull tight over the drum frame, let dry for a tight, snug drumhead

Pointers, info, just about anything other than the obvious no-brainer jokes very welcome at this point.

i belive all you need to do is get it clean, flesh and hair, and thats it.  
a "raw hide". some "sanding" may be in order if you need a uniform  
thinkness or thiness as the case may be.

but there are a bunch of folks on here with more experience, and i'll  
sure they will help.

Scrape, dry and go no further. You have usable rawhide. When your ready to use it, just resoak it, stretch it over your drum frame, secure and let dry. As far as braintanning cowhide, as far as I know it can't be done. I know a guy in Michigan that has tried to braintan and he says it is the only mammal he has tried to braintan that would not take to brains.

Hey Folk! First timer here, so a little about myself. Tracker student, know buckskinning, bow-making, and among other things. Practice my skills almsst daily and vary them a bit day to day.

Now my question is: Does anyone know different hide tanning technques besides other than chemically. What I'd like is something that can tan a hide like braining? Though I've heard Ivory soap does something like that?

Let me know, and thanks!!!!

Joe Schilling....;-)

Hey Joe whats wrong with brain-tanning? You can use a cow brain from the market. I've heard alot about trying to get around the old way and I think the key may be in the lecithin. Lecithin is in the brain mat'l suppose to make the hide soft. One fellow I heard of used crisco and lecithin but if memory serves me it didn't work very well. Too smelly or something. happy tannin'

There are some good books on brain tannin you might find in the library.  
one I believe is called Blue Mountain Buckskinning. You might also check the  
www.

Hi Dave,

Absolutely, the system works perfectly for smoking hides. You just lay them horizontally on the rack at the top of the tent, and then turn them over once in a while. You can also make the tent roof out of a skin or two, and they get smoked at the same time as the meat!

Cheers,  
Andr 

Subject: tanning turkey hides  
Content-Type: text  
Status: U  
X-Mozilla-Status: 0001

While this wasn't designed for turkey hides, the process may be adaptable.  
At least you can tan your hide and eat it too.

This comes from the book "Our Boots, an Inuit Women's Art" by Jill Oakes and Rick Riewe.

"Eider, murre, and other bird skins were used for stockings and over slippers when caribou skins were unavailable. .... Silatik Meeko provided a detailed description of the techniques employed by women on the Belcher Islands."

"Hunters bring back the eiders whole for the women to process. After the birds are allowed to partially thaw so the skin can be easily loosened from the meat, the wings and legs are taken off. The skin is sliced around the bill, another cut is made about halfway down the neck, and the head is pulled through this last incision. According to Meeko (1989):

"I hold the bill in my mouth, grasp the skin at both sides of the neck, and peel the skin down towards the tail. The skin ends up being inside out. After removing excess blood and fat from the skin, I turn it right side out and rub it in snow until the feathers are clean."

The long neck skins are tied together in groups of two, hung over a line outside, and allowed to freeze-dry overnight. Then the skins are turned with the flesh side to the outside to dry for about a day. When the skins are partially dry, the loose surface fat is chewed and pulled off, and the fat embedded in the skin is removed by an action similar to sucking on a baby bottle. Meeko also said that:

"Beginners quickly learn not to suck too hard, as you can pull the feathers right through the skin into your throat, but if you suck too gently, the skin becomes moist. It takes about two hours to prepare one skin until it feels dry. My throat becomes red and sore after sucking off fat for several hours, until I get used to it. I often gain weight from swallowing some of the fat while preparing bird skins."

Like I said, you may have to make a few adaptations, but it may be an alternative to subsisting on bugs!

Have fun.

I've taken a few skills classes from a group called the Miwok Archaeological Preserve of Marin at Pt. Reyes National Seashore north of San Francisco, and I think I recall hearing that the Coast Miwok used to tan pelican skins. You might be able to e-mail for more info to:

Ben, you always come up with the greatest questions!

In the Belcher Islands, way up north, the Inuit people one year saved their lives when the caribou did not migrate, by making coats out of tanned goose skins. I saw such a coat at the Yellowknife museum in the Northwest territories when I was up there researching on sabbatical leave one year.

The skins were cut in a rectangle, and the feathers remained on the skin to make an incredibly beautiful coat which was obviously very warm. I'm not sure about this, but I believe the skins were simply removed, meat and fat scraped off, then stretched out to dry. They are thin skins and simple manipulation would soften them. Judging by the color of the inside of the coat I saw, I would say that the skins were also smoked in a similar way as other hides.

I know this doesn't help much, but it's a start for experimentation!

Has anyone had any experience tanning a turkey hide? If so please let  
me know. Please be detailed. Natural, primitive or modern methods are  
welcome.

Thanks, for the response from CAGrean. I do want a method where it will stay soft. I think you may be on the right track, though, with using reptile tanning kits. That's kind of what I was thinking. There has got to be a way, though, without commercial bought kits. They tanned duck hides in the 18th century U.S. and made possibles bags with them. I've seen them in sketchbooks, but no explanation how they did it? Anybody have any leads on how they did duck hides? Maybe it would treat similarly. Thanks for not thinking me INSANE!

Benjamin,

I've been following this thread with interest because I made a Grouse Hat which still works (though it is a bit ratty and missing quite a few feathers) after 10 years. I've also tried it with other birds... just for the giggles.

> Anybody have any leads on how they did duck hides? Maybe it would treat >similarly. Thanks for not thinking me INSANE!

As they say, insanity is a state of mind... I think we share it. This is what I did.

With the grouse, I used the hot rock trick to cook the bird. When the bird was finished the skin slid off as it is supposed to do. I ate the bird. I turned the bird skin inside out and stitched the neck, wings and legs closed with gut from the bird and a needle made from bird bone. Nothing fancy. I filled the inside out bird skin with sand, till it was stiff. This made it easy to scrape the hide with another piece of bird bone. The sand protected the feathers. After it was scraped I used a borax/salt solution to wash the

skin.

I'm going to drop the narrative at this point and just go to the steps.

Let the skin dry for two days. It will feel starchy and appear to be semi-transparent. The feathers will be visible. Bathe the dry skin with a 50/50 mixture of glycerin and alcohol (the stronger the better Taquila is no good, everclear is ok and Isopropyl (sp?) works) don't drink the mixture. Rub the liquid into the skin until it begins to soften (I've been using the Alcohol/glycerine soak mix on snake skins for years. It works great with no other processing..... well.... pull off the fat with your fingers first!). If you want to, soak a rag in the mixture and wrap the skin. That will keep the mixture in contact with the skin for a longer period of time. When the skin feels fairly supple, open up your appendage holes and let the sand drain out. Carefully turn the skin back to the way it was when it was hatched. Now you can cut or wear the feather bag. It will remain fairly soft. If it stiffens just use the mixture again.

I've done this with quail, which is problematic since the skin is so thin, and even with a few sparrows (hacky sack sparrows). Give it a shot....

Incidentally, the sand trick is similar to the technique used to shrink heads... but that's another topic.

I'm anxiously awaiting other ways to perform this useless miracle.

Peace,

Ron Hood

Regarding tanning turkey hides. Does anyone feel confident enough to

attempt it for a person who has inquired of me in Los Angeles, CA? He apparently has money and says that money is no object and has a plan to make some money if he can find someone to tan several turkey hides for him. I hope this doesn't sound like an advertisement. I just can't think of a more qualified group to offer this opportunity to than all of you. E-mail me personally if anyone is interested and I will answer questions and give you contact information. I sounds like it could be lucrative for someone. I know our group isn't about money, but we all can use all the green we can get when we can get it. Thanks for the assist.

I don't think you can really tan a turkey hide but assuming that you want to preserve the skin with the feathers on I reccomend the following;

Skin the bird with an exceptionally sharp knife and try to keep it as complete as possible( i think you will run into some major problems around the tail and wings.

Clean off as much fat as possible ( corn meal works well in soaking up oils and fats in liquid form, just dust it on, let it absorb and clean it off.) Carefully clean off blood and viscera from the feathers with mild soap. You can preen the feathers after the skin dries so don't fuss over them too much.

Tack the flensed and cleaned skin with the fleshy side up to a board. Tack edges every 1/2 inch or so to hold the shape of the skin as It dries but don't stretch it out too much (bird skins are very elastic).

Cover the skin with table salt and borax (about 5 parts salt to 1 part borax) the borax will sort of sanitize the whole thing and prevent bacterial growth. The salt will draw out all the moisture left in the skin, and you may have to put a ne wapplication on as the first gets saturated. Keep the whole mess in a cool, well ventilated spot for a couple of weeks and the skin will be dry sort of like rawhide.

I did this dwith a porkypine and it worked real well, the whole thing deteriorated in about three years so if you want to keep the skin longer ( i was just using the quills so I removed them) you may want to try a snakeskin tanning solution sold by Tandy Leather, most Taxidermy suppliers sell quick-tan kits too. Try Van Dykes (they have an 800 no. I think. Good luck

CAG

Hi all,

A couple weeks ago I posted some wet-scrape resources. I mentioned that Steven Edholm and Tamara Wilder had a book out on Wet-scrape, but did not have the title or other information on it. I've since received a flyer in the mail. The book is called "Wet-Scrape Braintanned Buckskin: A practical Guide to Home Tanning and Use" ISBN 0-9654965-4-6 pr send \$17.95 plus \$3.00 postage to Paleotechnics, Box 876, Boonville, CA 95415.

Always Peace,

A few years ago I brought home a blacktailed deer from a hunting trip, and I turned the skin into rawhide which I later used to back a wood bow. I made the rawhide as follows:

- 1) Stretched hide on frame using parachute cord
- 2) Air-dried for several days
- 3) Scrapped the hair off with a home-made scrapper.
- 4) Scrapped the "membrane" off the inner surface
- 5) Sanded the surfaces

This was quite thin and quite beautiful, but the base of the hair was still visible as dark "dots" on the surface of the rawhide since I had not soaked the hide to get the hair out. I wondered whether I had scrapped that side enough, but I was afraid to scrape it further for fear of damaging it.

Anyway, I went on to cut long strips from the center to use on the bow, which worked beautifully, even though the bow had a "5 o'clock shadow". I took a wash-cloth-size piece of the rawhide to experiment with brain tanning, using the deer's brain:

- 1) Steam the brains in a pot on the stove
- 2) "Squish" the brain to a paste with my hands
- 3) Spread the paste on the rawhide and work until soft
- 4) Work the skin over a rope stretched between 2 trees, pulling and stretching it as hard as I could, re-applying brain solution when it began to get dry until I had used all the solution.

When I was done, the skin was very stiff and seemed to be somewhere between rawhide and buckskin.

Now, my question is this: Why did I not get nice, soft, white buckskin?

I have wondered if I was not aggressive enough with the scrapping of the hair side of the skin, preventing good penetration of the brain solution. Maybe I stopped the stretching process before it was completely dry. I would appreciate any suggestions the group might have.

It's hard to say. You may have overcooked your brains. I don't cook them at all. I just add water to the liquified brains that is hot to just about the point I can't hold my hands in the water. You also may not have did a good enough job scraping. It isn't as essential that you

scrape the flesh side as well as you need to scrape the hair side as far as brain penetration goes. You must remove that shiny epidermis and membrane that appears on the hair side as well as its equivalent on the flesh side. You also need to do more than just smear the brain solution into the hide. You need to get that hide in the solution, work it into it, take it out and wring it thoroughly several times within a one hour period, depending on how good a penetration you are getting. The way to test if you have good enough penetration of the brains is to stretch the hide in all directions. If it has good penetration it should significantly stretch as you pull it. To get a good pull put your knees together, stretch the hide over your knees, then spread your knees apart, pulling the hide while doing this. Turn it around several times while doing this. This is also the process I recommend you should try for pulling (breaking) a hide dry. Which is the other thing you could have done wrong. You need to keep a hide pulling until it is completely dry. Don't let it fool you. To test for places where moisture is hiding feel for cold spots on both sides. If you can detect moisture, keep pulling. The advantage to pulling it on your knees in this manner as opposed to putting it in a rack and breaking it with a paddle is several fold: 1) You don't have to put it back in the rack after taking it down. In fact, you can just trim it out of the rack. 2) You can quit if you get tired, just fold it up, bag it up and throw in the freezer. When you take it out don't thaw it completely, just enough to shakre the ice out of it. You are freeze drying the hide when you do this and the ice expansion does some breaking to the hide.

Now I have been assuming dry scrape in the above. If you were dry scraping make sure your tools were good and sharp and your hide is thouroughly tightened up in the rack and thoroughly dry before you scrape it. If you were wet scraping, make sure you soaked the hide in water long enough for it to swell enough that the layers kind of 'float' so you can clearly see the layers you need to scrape, so you do a thorough job of scraping. Hope this helps.

I just have a question in general about brain tanning. I've seen it done and seen the results, but nobody has ever told me where you get the brain. Do you kill the animal yourself and split the skull open? (makes the most sense to me)

Ben, thanks for responding to my question about brain tanning. I like the idea of stretching the hide with the knees. I am still uncertain, however, about how deep to dry-scrape on the hair side. When you have scrapped off the shiny epidermis, should the base of the hair follicles still be visible? I thought I had gotten the epidermis off, but I still had hair follicles visible in the hide. Should I have kept going? I've never seen it done, and it's hard to tell from the descriptions I've read.

Mark: There's a book out on dry scrape brain tanning that I found to be an excellent resource. It's called Blue Mountain Buckskin by Jim Riggs. It Costs \$12.00. Write him at 72501 Hiway 82, Wallowa, OR 97885 The Book is very well written and Jim has a great sense of humor. You'll find it answers a lot of questions. Even ones you haven't thought of yet!

There was a question of how do you get brains. Supposedly, each animal comes with enough brains to tan its own hide, but friends of mine that do a lot of brain tanning get pork brains out of the meat section at the grocery store ( you might have to hunt a bit. Not all stores may carry it).

Keep on Truckin'

Neal,

Cow or Pig brains work great. Go to this URL

<http://www.lib.uconn.edu/NativeTech/tanning/tanning.html> and you will learn  
a great deal about Brain Tanning and some other great stuff on tanning.

I hope this information will be of help to you and others that like to Tan.  
Good luck and I wish you well.

Gary

Things turn out best for people who make the best of the  
way things turn out

Just a couple of thoughts from my own experience. Some hides require much more than this though and in fact I have had to brain and stretch several hides more than once to get them to break. I do all my stretching at this time in a rack and use a variety of tools of varying sizes to work the hide. The toughness of the hide seems to vary based on several factors- time of year the deer was killed (summer and spring hides are much thinner and easier to work than fall or winter hides), size of the animal (although this theory breaks down also at times). There are those that argue that buck hides are tougher to tan than doe hides. I have not necessarily found this to be the case. I've seen some mighty thick and tough doe hides in my day.

I am still uncertain, however,

> about how deep to dry-scrape on the hair side. When you have scrapped  
>off the shiny epidermis, should the base of the hair follicles still be  
> visible?

Sometimes they are, but I have not found this to have a tremendous impact on outcome of the tanning process. Every hide varies greatly. Sometimes there is just no accounting for a why a hide does what it does. In my process I do do some light scraping while I am stretching to get off any flecks of remaining epidermis and to begin buffing out the

hide.

>I thought I had gotten the epidermis off, but I still had hair  
> follicles visible in the hide. Should I have kept going?

I think whether you continue scraping or not depends more on the thickness of the hide than anything else. You can scrape through. I usually play this one by ear. One thing I know, though, is that I have less of a tendency to leave hair follicles on the hide if I am able to scrape the hair and epidermis off in one single phase of the process. Where there tends to be situations like this is when the hair has slipped out previous to scraping, but this is no hard and fast rule either.

>I've never seen it done, and it's hard to tell from the descriptions  
>I've read.

The classes on tanning that I teach have at times offered "grief counseling" to those who have tried to do this from a book :-). I mostly think that the bulk of the books on the market might serve better as smoking materials than reading materials. I speak from experience on this too, having attempted several hides using several processes I found in books before apprenticing with a tanner in my area.

Keep at it, though! Believe it or not this process is possible and the results blow every other tanning method I have ever seen out the window, without exception.

Happy tanning,

Mark Zanoni

Yes, sometimes I do take the brain out of the deer whose hide I am tanning, In general, one brain will do 2-4 hides, depending on the method of braintan you are using. As far as brain use goes though you can use any kind of brain. I just as often buy the frozen pork brains in the frozen foods section of my grocery store. Once, at a demo at a national park, I ran out of brains and could not find frozen anywhere and used the canned variety in gravy. It worked just fine, but was a little more expensive.

Some hair follicles go deeper than others. Mainly you want to remove the

shiny epidermis. This will allow for brain penetration. It will not affect how well it is brained. It may affect how it looks, though depending on how visible and prominent the hair follicles are. It is a judgment call. Try to go as deep as you can and try to get past them but watch how much you are thinning your hide. If you're thinning your hide more than you wish it is time to stop. There is one point that it is very evident how much the hair follicles are going to show. When it is brained the hide will be milky white. At this point any hair follicle that are going to show on the finished product will look like like a 5:00 shadow or pepper all over the hide. Not to fear. Get it on a fleshing beam and work on those areas a little more. Any hair follicles that are left after the hide is smoked, depending on how dark you smoke it, will kind of look like a dirty patch. You're still not lost. You can soak the hide even after it's smoked and take it to the fleshing beam, re-brain it, re-break it and then smoke it again, if needed.

Subject: Tanning Turkey Hides

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

X-Mozilla-Status: 0001

Someone gave me this explanation on tanning bird hides from a book. It is an OK book, except for their "primitive tanning" chapter. The author knew absolutely nothing about braintan. I did like the section at the back, though, that contained many formulas for tanning solutions. I thought I'd pass it along (following sig.). Incidentally, I never heard from anyone yet that might be interested in tanning some turkey hides for someone I know for the money.

(Stackpole Books) ISBN 0-8117-1719-4

## TANNING BIRD SKINS

One of the most gratifying projects the home tanner can embark upon is the tanning of bird skins. They can be used for wall trophies, preserved so the feathers can be used later for fly tying or feather pictures, or used for decorations on clothing and hats. To my way of thinking, the tanned and mounted skin of a game bird in full plumage is a fine trophy.

### Skinning the Bird

Some of the bird skins that can be tanned are those of pheasants, ruffed grouse, wood ducks, and mallard drakes. Birds, like animals, skin most easily before the body heat has left them. Before you start skinning, plug up the mouth, nostrils, and vent with tufts of cotton to keep body fluids from staining the feathers during the skinning process. Then select a sharp knife with a point and make a slit from bottom beak to the vent, using your fingers to spread the feathers ahead of the knife. Many birds have a part between the feathers at this location and if you follow this line you will be cutting it in the center. Don't cut into the meat of the breast, but cut just through the skin by pushing the knife point ahead of the cut.

Once this first slit is made you can start working the skin off away from the cut on each side. Do this with your fingers by grasping the skin in one hand and pushing on the meat with the other. Continue separating the skin from the meat, working as far as possible down the sides of the breast and toward the tail. Work the skin off around the legs and down toward the back, always pushing the meat away from the skin rather than pulling on the skin.

Once you get to the leg joints, cut them off at the knees and continue to push the tips of the fingers around the leg skin until the legs are free. There is very little fat between the skin on the bird's back and the bone, and so it is the hardest to remove. In some cases it might be necessary to push the knife point between the skin and the bone

to free the skin, but care must be exercised. If a cut is made it can be sewed up to keep the feathers from protruding inside. When you get to the tailbone just cut it off and leave it on the skin. You also have to cut the gut off at this point. Use your fingers to push the meat away from the neck bones until your fingers can get all the way around it. When you reach the head, cut the neck and invert it, and then you can use the tip of the knife to cut the skin loose, using great care around the ears and eyes. Sever the beak mandibles at the head and leave the beak on the skin.

The wings are extremely hard to skin out in some birds, but they are also the most attractive part; therefore, whatever care is taken in removing the wing skin will be rewarded. I have had good luck by pushing the skin outward from the wing muscles until the wing joint is reached and severing the wing joint at this point. Usually the meat of the last joint will dry without putrifying and loosening the feathers. If you don't care to take a chance on this, inject formaldehyde with a hypodermic needle into the meat of the wing. On extra large birds, make slits under the wings and scrape away as much flesh as possible.

### Tanning the Skin

It is not advisable to immerse a bird skin since the tanning fluids will mat and dull the feathers in most cases. It is better to scrape away the flesh from the skin as much as possible, and then tan it with a paste. Borax alone will keep the bird skins from rotting if they are kept in a dry place, but an alum tawing mixture will tan it very well.

Make an alum mixture by combining 1/2 pound of aluminum sulfate and 1/2 pound of salt. Add enough water to make a paste, stir it very well, let it set for one hour, and then thickly coat the flesh side of the bird skin. Cover it with a plastic sheet and let it set for two days. This will probably tan the skin, but to be on the safe side scrape off the first coat and apply a second coat. Let this stand covered for two more days, then remove the covering and let the paste dry on the skin. Scrape it off to finish the tan.

Sometimes it is desirable to tan only the breast of the bird for a wall trophy, especially when the feathers will be used for fly tying or millinery. Skin out the bird's breast by running the knife across the point of the breast and forward under the bird's wings to the neck. This

will cut out a section which will include nearly all of the breast feathers. Tan the breast by stretching the feather side down on a board; then coat the flesh side with the alum paste.

If you don't intend to keep the skin more than a few weeks it only has to be dried to keep very well.

Hi Joe,

I've seen indians in the northwest territory use Ivory soap instead of  
brains in exactly the same manner as the braintan method. That should  
get you on your way.

Check out the film "Indian Hide Tanning" by Henri Vaillancourt for an  
explanation on this.

Good luck with your project...

Joe,

I've heard of people using "Joy Dishwashing Liquid" to tan hides. A friend of mine who spent time in Alaska says this is how lots of folks in the "bush" get hides tanned. Joy contains lanolin, which I suppose is the active ingrediant that does the job.

Another one I have heard of, but not tried is "Neats Foot Oil". I don't know how this stuff is made but, it may have lanolin and other similar chemicals in it in similar amounts to animal brains. It would certainly be worth a try, huh?

Hope this helps,

Mark Zanoni

Sorry, I too would like to have a source for crooked knives. I know of a museum who purchased some replicas, but I'll have to find out where.

I make my own crooked knives from old files or old sawblades, because I use them a lot when I make birchbark canoe ribs and planking. I find the commercial crooked knives too long for comfortable leverage, and I don't usually like the angle of the handles. This is a very personal tool, and you will get sore real quick if it doesn't fit your hand just right.

I have read about something called a "crooked knife," a combination drawknife/gouge/all-purpose trail knife. I am in possession of C. Keith Wilbur's very clear instructions for making one, but I am not a blacksmith. So I wonder if there is anywhere I can

simply buy a "crooked knife."

Thanks!

I heard that they used to be available through Hudson's Bay Outfitters in

Canada. That may be in error. Andre or any of the list members in Canada or Alaska, have you seen any of these available? I understand that before the coming of the Europeans that beaver tooth crooked knives were made.

There's a mail list called "theforge" whose members are mostly blacksmiths. Some of them are knife makers, and might be able to help you if you can provide information about what a "crooked knife" looks like.

To subscribe, you can reach them at:

listproc@wugate.wustl.edu

Send this message:

subscribe theforge

Hope this helps.

Fred

If you are speaking of what I am thinking of, Russell still makes this  
knife (aka Green River Knives). It is merely a skinning knife with an  
exaggerated curve to the blade which gives it a lot of belly so that long  
skinning strokes can be taken. I think that I have seen them for sale in  
the Dixie Gun Works Catalog (Union City, TN) I will check and report to  
the group if there is any interest.

Some Green River skinning knives are on the Jason Townsend and Sons website. They are 18th and 19th Century reenactor suppliers. You can get a Green River Buffalo Skinner or a Heavy Skinner blade blank and cutlery rivets and walnut handle slabs, all for under \$15 (not counting the hacksaw and sandpaper or equivalent you'd need). These knives look like a steel boomerangs. Take a look and see if that's the "Crooked Knife." Loads of all kinds of neat stuff. I like their Throwing Knife, their Leaf Shaped Spear Point and their wrought iron flint stiker.

I don't know for sure, but here are several blacksmiths you can inquire to. Arrowhead Forge is probably your best bet.:  
Arrowhead Forge, R.R. 1, Box 25, Wilmot, SD, Phone: (605) 938-4814  
Many hand forged items; knives, various iron and steel items  
blacksmith made.  
Bell & Co. Traders, 6030 Anton Rd., Madisonville. KY 42431, Phone:  
1-800-844-5421  
Four Winds Traders, P.O. Box 9677, Pittsburgh, PA 15226-0677  
Great River Blacksmith Shop, Keith R. Johnson, & Sons, Rt. 2, Box 213C,  
Bemidji, MN 56601,  
Phone: (218) 751-9433. FAX: (218) 751-9433  
RViís Fire -N- Five, P.O. Box 8019-56, Blaine, WA 98230  
Centaur Forge, 117 N. Spring St., P.O. Box 340, Burlington, WI  
53105-0340, Phone: (414) 763-9175

Sorry, Barent, that's not a crooked knife (well it is, but not the kind we are talking about). A traditional crooked knife is one which has a curve on the flat side of the blade, and a handle at almost a 45 degree handle. This permits using it as a one handed drawknife without the tip catching in the wood, and also using the curve as a gouge.

This knife was (and still is) a very important tool for the indians from around there who use it for whittling anything from snowshoe frames to pegs for pegging birch baskets etc.

Hi. Just a bit of blacksmithing I learned while growing up. If you need to know the tempering range and colors of a particular piece of iron or steel, heat and hammer out a 1/4"square rod of it about 12 " long (Lengths are really up to you, 12 " is a good starting place). Then spreading your coals so that you get a gradual increase in heat on the rod, heat the rod so that it shows a range from no color to bright spitting white (burned). Quench as you plan to do for this metal (Water, salt water, oil or sand it makes a difference in how fast the metal is cooled). Now remembering about where the different colors were, lay the rod across your anvil and break it (a two pound sledge is good for this). You will end up with things like this. White spitting area, the metal breaks easily. Bright yellow, the metal breaks but not as easily. All the way back to no color where the metal has the same resilience as it originally had. Somewhere in the color bands you'll find the combination of hardness and ductility you need.

Enjoy

Merv

Dr. Bourbeau:

You asked a couple of weeks ago about a canadian source for crooked knives. I'm sorry its taken me so long to get back to you but I only just got around to reading the Crooked Knives thread.

You can obtain these from:

Iroquois Publishing and Craft Supplies, Ltd.  
R.R. #2, Ohsweken, Ontario, Canada N0A 1M0  
Phone: 905-765-4206

They do not take credit cards. All prices in catalog are in \$CN but on mail order they trade \$US and \$CN as the same. (penalty for US buyers).

Their catalog listing for crooked knives reads as follows:

CROOKED KNIVES This traditional Woodlands indian carving tool is not found easily today. To remedy this scarcity these have been custom made from old files to our specifications. Used to hollow bowls, spoons, masks. In northern Canada they are known as 'canoe knives' for their value in working wood components in canoes. Available already hafted so you can begin carving immediately, or without handle for craftsmen who want to fashion their own custom grips

|            |         |
|------------|---------|
| Blade Only | \$ 9.95 |
| Hafted     | \$12.95 |

I was just reading a post from Merv Martin and I wanted to throw my two cents in. Iron Ore can be collected in and around streams the same way the miners panned for gold. The fine black dust left in the pan towards the top is usually fairly decent Iron Ore. As for locating the stuff, I have found it in the same places you would find Iron Pyrite (Fools Gold) and Gold.

Thanks Merv,

if you have any information about small survival based Iron Ore smelting I would be very interested in hearing from you. How do you melt the stuff without a crucible? Or better yet how do you build a makeshift crucible?

All Good Medicine,

Marc Besse

There was an episode on New Explorers - public tv - in which old time smelters in Africa demonstrated the craft. The process took several hours, appeared exhausting and was said to be very smelly, but worked. For bellows, a leather or rawhide membrane was placed over what looked like a huge clay pipe and the pipe inserted into the smelter. Sticks were attached to the membranes and pulled and pushed rapidly. Instead of coke, charcoal was used.

The end product: a hoe.

you can make a crucible from clay that will hold up fairly well, just be  
sure to dry and fire it thouroughly first. in one of the older national  
geographic magazines, 1978?? there was an article on smelting by native  
peoples in africa. they did not us a crucible, but let the smelted iron  
run out onto the ground. afterwards they forged out the refined iron into  
quite nice spear heads. i will look for the article.

The foxfire books also mention smelting ore. Now, I don't remember how  
exactly to make coke. But for the sake of a space filler and to start the  
search I think it's coal that has been burnt in the absense of oxygen,  
like charcoal. Coke and iron ore mixed in a dirt and clay kiln can be fired  
and (I'm trying to remember how it was done in those books. Mine are in  
storage) a fairly good steel results. Also meteoric iron has been valued  
for a long time. =20

Now the only form of iron ore I know of can be found around Shasta Lake.  
It's a dark rusty black rock with rust colored veins. (sorta). Very heavy  
and pulls a compass needle. I don't know where to mine it. This stuff is  
right on the beaches.

I believe you can build a forge in sand. I know that a brick forge can be  
fired with charcoal. Just takes a bit longer to build heat.

You'll need a couple of pounding rocks. Probably best to use iron ore for  
an original hammer and anvil. =20

What kind of tolerance would you need on the bearings for you lathe? How  
about tools?

Take Care

Wood turners used to use springy saplings to drive lathes. I've seen books that refer to this, but haven't been able to find one that has diagrams for building one.

I asked about this on a woodworking list. One of the editors of American Woodworker emailed me and suggested I check out the October 1996 issue which had plans for a bungee foot-powered lathe. I got this issue and it has a wonderful example.

This example led my thinking off in two directions.

1) Suppose your camping survival equipment included some bungee cords. How could you rig up a lathe that doesn't require the 20 sets of lag screws, carriage bolts and foundation bolts involved in the bungee lathe?

2) Suppose there aren't any available bungee cords. Has anyone seen detailed descriptions of the sapling version?

With either version 1) or 2) does anyone have suggestions for using a knife as the only turning tool? Or perhaps more useful and interesting...any ideas on knapping some turning tools? For the first most useful objects tools that could make bowls/cups would probably be the most useful. Beyond that, I'd be interested in other creative items as well.

Once beyond minimal survival, but very primitively done, I'm also finding wild furniture to be very interesting. This is made from peeled or unpeeled limbs. Daniel Mack, the leading maker of this furniture uses 6-7 tools to make this sort of furniture, but after having read two of his books, it looks to me as though they could all be made with only a knife. If you had a knife and saw, you could really make faster headway though. Mack is quite good at using the natural branches of the limbs to achieve his functional and design goals.

Daniel Mack's books are Making Rustic Furniture(1992) and The Rustic Furniture Companion (1996). In addition to the functional aspects of the info in these books, I also enjoyed them for expanding that part of my thinking that focuses on creatively using what is available.

I hope also to see a copy of Green Woodworking by Mike Abbott (1989) which has been suggested to me. It has info on footpowered lathes, and may have more clues about the sapling powered ones.

I'd be interested in hearing from anyone who has tried any of the primitive turning or has ideas about innovatively knapped tools that might work or who has other thoughts about combining these skill areas.

good post sharon,

i can see the possibilty of the use of sapling, bows, counter weights,  
etc. but what i would be curious about are the bearings, and how  
one could make a "primitive" bearing, or head and tail stocks.

a flint/chert edge lassed into a stick should make a fair cutter,  
but i would think it would dull rather quickly, and require frequent  
edge retouching.

on a labor basis, i would also wonder how cup and bowl manufacture  
would compair to the burn and scrape method.

being able to turn out straight shafts, for arrows, atlatl darts, might  
be a real plus.

also the idea suggest the possibility of a horizontal boring mill  
with a flint tipped cutter.

Sharon, et al:

This is just a creative idea, I do not know how practical it may be. Please let me know what you think. First, I was taught a primitive vise for if, say, you are working on a bow. What you do is carve a waist-high notch in a standing sapling that is slightly more narrow than the riser/handhold of the bow you are working on. You bend the sapling to open the notch wider, insert the bow, release the sapling and then, perhaps, attach a rope to the top of the sapling and tie it off to another tree or stake it to keep the notch closed tightly.

My creative idea is to use a sapling at each end of the lathe piece to hold it. Maybe with a soapstone bearings greased with fat or wax. Then use a third sapling, cut down and stripped, that has a notch in it like above, but is balanced and attached to the work piece as a fly-wheel.

At Fort Williams in Thunder Bay, Ontario, the primitive lathe bearings=20  
are made from greased leather.

I can't imagine that making a lathe in a primitive context would be=20  
possible without metal, or that the effort expanded would be worthwhile,=20  
but I would love to be proved wrong. Interesting thought, though.

1. I suggest you look at designs for primitive pottery wheels.

2. But, wood is much tougher than wet clay. I'm surprised you can build a bungee-powered lathe. I've worked a lathe, and the force I had to apply was remarkable. I wouldn't expect any primitive lathe to be very effective. I don't know what you're going to use as a cutting surface if not steel; I think a stone tool would break in about a second. Also, wood chips fly off at high velocity, so I would not even consider constructing a lathe unless I had my survival high-impact plastic goggles along. Maybe you could make some slit-based eyewear, like Eskimo ice goggles.

It's a worthwhile effort. I'm just playing devil's advocate.

Aversion of the sapling powered lathe was in use until very recent times, in fact may be still in use, in the beech woods around High Wickham. There was a type of itinerant tradesman called a bodger who set up an ad hoc lathe in the woods. There were two dead centres and a cord attached to a tall sapling and wound around the piece being turned and then to a pivoted pedal. Pressure on the pedal rotated the piece for cutting and the sapling pulled back resulting in reverse rotation. With this primitive gear supplies of turned chair components were produced for the chair making industry centred in High Wickham. I cannot offer references but the methods have been described in the past in Woodworker magazine published in UK and in English books on wood turning.

There was info on sapling powered lathes in one of the Foxfire books.  
As far as assembling the equipment you would use standard woodworking  
tricks such as dovetail notches and mortise/tenon construction. Use wood  
pegs as nails/screws.

Roy Underhill has authored several books with information on early lathes and wood working. 'The Woodwrights Shop' and 'The Woodwright's Work Book' both have information on treadle lathes.

Also check out any information you can find on 'bodgers'. These were the craftsmen who turned out early turned chair parts. They worked in a camp in the forest and turned the wood green. I recall an article on them a few years ago in one of the woodworking magazines, maybe Fine Woodworking or Woodworking Journal.

I saw an 1800's lathe in a woodwright's shop at a reenactment village that seemed to work rather well. I don't recall all the details of it, but it used a sapling above the work and a foot-operated treadle below it to spin the wood (foot treadle spun the wood and bowed the sapling and sapling sprang back to help pull the treadle back on the up stroke, helping to keep the wood spinning). As best I can recall, a leather strap connected the sapling and treadle, with a wrap or two around the wood stock, and I think the wood was supported by/spinning on two points made of iron. The wright used iron cutting tools; the spinning wasn't particularly high speed--wood shavings covered his hands and wrists, but weren't flying around...

Foxfire Book 5 covers ironmaking in the southern US.

The simplest process is making wrought iron. This was done by "cooking" the iron ore in a small open furnace called a bloomery. The bloomery was made of stone, fired with charcoal and blown upon with a bellows.

Impurities would burn off and the iron would then be hammered. The iron would be heated and hammered several times until the slag was evenly distributed. The resulting slab of wrought iron was known as a "bloom". I do not know where the name came from or what it means. Furnaces of this type were used quite a lot early in the US but were replace by cold blast furnaces later on. Here in the southern US mostly charcoal was used until after the Civil War.

The making of wrought iron, while unknown in the Americas until Europeans, is a primitive skill skill although I don't know if it is the guidelines of this group. I am sorry if it is not.

X-Mozilla-Status: 0001

Just after I joined the list last week, there was a post that asked about making hide glue from rawhide, and I don't think I've seen a response. I'm sorry I don't remember who asked, but it was from someone who had tried it using a "chew bone".

I have made hide glue successfully with rawhide trimmings from a deer skin as follows:

Place the shredded bits of hide in a crock pot, add water to cover, and cook for 24 hr. Pour off the liquid (which was pretty thin at this stage) through cheese cloth, and place it in a shallow pan. Simmer this until it is reduced in volume and has attained a consistency of thin warm syrup. You got glue!

If you are not going to use it immediately, you can pour it into a clean glass jar and let it cool. It will keep for a few days in the refrigerator. If you need to keep it longer, pour the liquid glue onto a cookie sheet with a lip, so it's about 1/4" deep, and chill (or just let it cool at room temp.). It will turn into gelatin. Slice this into little cubes about 1/4" square, scatter on a cookie sheet so they are not touching, and let air dry. Mine dried over night with the help of a little fan. Now you've got little amber chips that will keep for years. I've still got some in a jar that I occasionally rehydrate (all small amount of

water and warm) and use. It is 4 years old. I tested its strength gluing 2 squares of fir together, applying a C-clamp, and allowing it to dry for a week (that is more time than you need to let it dry). I could not separate the pieces of wood with my hands, and when I used wrenches to twist them apart, the wood gave, but not the glue. It's strong stuff.

I haven't used "chew bone" for this, but I don't know of any reason that it should not work.

Hope this is helpful.

If you want a shortcut to hide glue, and want to glue something in a hurry, use plain Knox gelatin mixed to the same consistency as hide glue. This is from THE TRADITIONAL BOWYERS BIBLE

you might want to try sewing with a boar' bristle or a peice of horse hair. all you have to do is double over the bristle or hair and wax the ends so that they stick together (you can also use pine pitch) and form an eye on one end. thread your cordage through the eye and push the hair through a hole punched with an awl. I think you will find this much easier than just trying to push the cord itself through the hole. I have used this technique myself and find it works very well. -ketil

I just read in an eskimo book by Fred Bruemmer that eskimo people used  
to make bone needles from the wing bones of seagulls or snow geese.  
Anyone have any idea precisely which bone of the wing was used? Anyone  
actually tried sewing with a bone needle?

Thanks for any answers you might have.

AndrÈ

Somewhere during my readings I saw an illustration on the making of a bone needle, but I forget exactly where I saw it. Apparently two methods were used however. Percussion smashing the bone into splinters then polishing the splinter and drilling a hole to hold the thread/sinew. The other method is graving the bone, drilling a hole and polishing the needle with sandstone or some other fine abrasive. If I find my source I'll send you the name of the source.

Speaking of wing bones and their uses. I just read that small bird wing bones were used to inject some indian meds as they are hollow inside.

Probably because of the relative size of the goose and seagull in relation to the other birds. Larger birds, bigger wing bones, stronger splinters.

Actually I think an awl is used to make the holes and the needle carries the thread. It wasn't until metal tools came along(and the glovers needle) that the awl wasn't needed so much any more.

My experience of sewing with bone needles: I usually construct a bone needle from harder bone, like leg bone of deer. I suppose any bone would do, though, that you can grind down flat or small enough in diameter where you don't have a huge hole left in the material you are sewing. Before grinding, though, drill your hole for receiving the thread first, then grind the bone down around it. The reason for this is that the needle will split if you try to drill it after you make a needle. Better to grind it while you have plenty of bone than to spend all that time grinding to only have it split on you when you drill it.

However, the method I use most for sewing in a survival, primitive situation is to grind a bone to a point and use it as an awl. Use the awl to pierce a hole in the material to be sewn and then feed your thread or thong through the hole. You make your thread pointed in the case of a thong to make this easier. Bird bones (particularly wing bones) work well in this application for use as awls. Any bone will work, though as will a sharpened stick or a sturdy thorn.

It sure can! I play a game with my students every year. It goes like this. Suppose I'm the runner. I wear a pair of boots with distinctive soles, (cross country shoes with a cross on the sole), and the rules are that I'm not allowed to take them off or cover them with anything. We do this when there is only a few inches of snow on the ground. I get a couple of hours head start. Then the stalker (or stalkers) have to follow my trail to the end.

Now you can get good at this. In the last couple of years, I've yet had

a student be able to stalk me, (and sometimes I can't stalk my better students).

There are a lot of tricks at this game (walking backwards, climbing trees and having them bend over to 20 feet further etc), and it's a lot of fun. People are brilliant, much more so than animals, which is why they are so difficult to track.

Andr , "smarter than the average bear", hi,hi,hi.

>>> Stalking people

>THE MOST DANGEROUS GAME....

>

>What a fantastic story for a 12year old to discover. Sorry, I do not  
>remember the author. There were several movies based on this story.

>While most of the older readers of this list have probably read, maybe  
>some of the younger members have not.  
>

I remember reading this as a short story in a SBS soft cover book back in the seventh grade. About 10 years ago, I found a videotape of an old movie with the same name, same theme, but different characters. I think the film was made in the 1930s. I think the fainting/screaming female actress was Faye Wray of King Kong Fame. If anyone wants to know the title, date, etc, I can dig out my videoarchives and look it up.

Perhaps a much better movie with a man hunting theme was called "The Naked Prey", starring Cornell Wilde. The story took place in the 1800s when a hunting safari upset the natives by not giving gifts for passing through their territory. All the great white hunters were captured and tortured to death. On Cornell Wilde was given a chance. They stripped him down to naked and gave him a running head start. Then 5+ seasoned warriors with weapons took off after him. He not only had to elude them, he had to survive off the land and make it back to a European settlement. This is one of the best movies I have ever seen. Violence? Yes! But not upsetting like the garbage you see on TV cop show. Your heart will pound through the whole movie like a caffeine rush. If you like this kind of movie, go rent it at your local video store.

Without reference to the book or various movies on the subject, I have got to tell you that nothing will get your adrenalin (sp?) going faster than this. In the army we use laser to tag each other with, not exactly primitive, but an excellent learning experience. If you have any survival instinct at all you learn to be alert at all times and to use teamwork to get all things done while maintaining security. I particularly like the idea of the rabbit and the fox (we already use this as a running and biking training enhancer but its just a flat out chase) for tracking and stalking. This idea will be used by me in the near future. thanks

I know the best trappers in QuÈbec. These guys are also scientific biologists and do research for the ministry of natural resources. For example, they have put collars on hundreds of wolves in Parc des Laurentides and have been following their movements. They do research on how trapping can be used to actually augment the faunal capacity of an area. Roland Lemieux of QuÈbec took over a trapping area 25km square and augmented his fur catches of fox from 1 to over 30 per year over a 10 year period. All of his other captures have seen similar jumps. His trapping area is now at a peak which he can maintain year after year.

Roland knows animals better than anyone I have ever met. He and his research team have studied animal tracks and scats scientifically and have published a great deal of material and videos on these subjects (all in french, sorry). I have spent time in the woods with Roland, exchanging survival tricks for trapping and tracking knowledge. Everything he has shown me is measurable, repeatable, understandable, and perfectly logical. Anyone can learn it.

Before I read the Tom Brown thread and looked at the Tracker archives, I thought what I had been learning with Roland Lemieux and through books such as "Field guide to animal tracks" was what learning tracking was all about- studying animal tracks and feces to learn about their habits. Now I realize that there is another dimension to tracking which many people practice, which refers to improving the individual's capacity to be "at one" with nature. This other dimension to tracking is a spiritual one which involves psychology and individual belief systems. We have all agreed not to discuss these issues.

Therefore, in accordance with the guidelines set forth by this group, I would ask everyone to limit tracking discussions to physical tracking skills. For example, to find out if there are muskrats in a small stream, you can look on rocks or logs which are sticking up out of the water. If there are muskrats, you will find scats there. The number of scats on the rocks or logs will give you a vague indication of how many muskrats there are in the area. Muskrats dig holes in banks which sometimes go to the length of 80 feet. This information makes us aware of the futility of digging for muskrats in survival situations. I would love to hear more about animal habits which would make their capture easier in survival situations.

However, I would ask everyone to please respond to those aspects dealing with non-physical tracking skills off-line. I insist.

Thanks for reading,

AndrÈ

I think that this all belongs in the category of becoming native to a place. From past observation you know the behavior of a creature, you know where he is likely to be at a given time, and can form a plan around that familiarity. The sometime nature of game availability forces one to use as much of that animal as possible. You know what materials to build a shelter from, and what materials to make cordage from, because you know the nature of the materials in your area, and what properties are needed for what you need. I would think that tracking is also such a skill, that would be needed in one way or another if you are hunting with primitive weapons that do not put animals down immediatly. The Bushmen of Africa hunt with poisoned arrows, allegedly depend on their tracking skills to find game since no venom works immediatly. I guess it depends on what you call tracking. If an understanding of animal behavior counts as tracking as much as the scuff marks and foot prints of game, then all primitives tracked one way or another. As far as the penetrating nature of stone points, they have been found to have better penetrating and wounding capabillity than steel.

So much so that what some mistakingly call bird points are actually big game points.

I both agree and disagree with you. I don't believe that perfection or complete re-creation of paleo lifestyles is possible. I don't practice these skills in order to do that. However there are scientists who base theories on skills practice and they do so without taking into consideration the total package. Further, I have a hard time seeing how it is possible to even understand and incorporate the skills we do practice successfully without understanding how the natural world works. Tracking, in my opinion, is much, much more than reading footprints. It is a total crash course in the "language of nature" and involves an understanding and familiarity with natural systems (not just animals) that goes way beyond anything I have yet encountered. It would seem to me that going off into the woods without it, would be a lot like learning to drive without an understanding of traffic laws, road signs or the English language. It would be possible to do, but the chance of making a mistake, getting hurt or getting lost would be a whole lot greater. It also makes the process of wilderness living an adventure with your friends and relatives rather than a struggle in an unknown world.

Sounds like I would love to meet these guys.

> Everything he has shown me is measurable, repeatable, understandable,  
> and perfectly logical. Anyone can learn it.

Tracking and its attendant skills are that way. All the visual perception techniques and methods of seeing tracks in difficult ground covers work and there are logical reasons for why they do. Those same techniques can be applied in locating animals in cover (or in trees :-)) and the methods are teachable and reproducible. Learning tracking also involves learning about the animals you are tracking, getting a visual picture in your mind of how they move and how they live. This same process can be applied to learning about other aspects of nature-plants trees and their relationships, geography and geology etc. etc. A good archeologist (did I spell it right?) or a good geologist is just a good tracker. They are tracking cultural or landform patterns, but the process is essentially the same.

> systems.

Andre', there is no reason why we need to touch on the spiritual aspects of tracking to talk about how the practice of this skill affects a persons relationship with the natural world. In fact, the "shifts of consciousness" I'm talking about may indeed have perfectly rational explanations. I would argue that it is the same kind of thing that athletes, artists, musicians etc. go through when they do their thing. There is no great mystery to it. It involves a total process of complete immersion and involvement in the natural system requiring both right and left brain types of activity. I'm sure, actually, that it is not all that disimilar from the process your trapper friends use, as it involves gathering information and knowledge, constructing theories, proving or disproving the theories, solving problems etc. etc. It is in short a process of total natural world education and acclimatization.

>We have all agreed not to discuss these issues.

Like I said, there is no real need. The mystical is there, but you are right to argue that it is primarily an individual thing. The skills either teach it themselves or they don't depending on the perspective the practitioner is coming from. What I am advocating is not necessarily of that nature.

>

> Therefore, in accordance with the guidelines set forth by this group,  
>I would ask everyone to limit tracking discussions to physical tracking

Not a problem, Andre'. This is all part of the package I'm talking about.

> love to hear more about animal habits which would make their capture  
> easier in survival situations.

Is this the only aspect of tracking we can deal with? Why are we limiting our discussion to this one small part of this skill? We don't do the same for any other skill we talk about. Are visual perception techniques, methods of seeing and interpreting tracks over various groundcovers, reading trails, runs and sign, track pattern analysis, animal behavior and life habits etc. etc. off limits too?

>

> However, I would ask everyone to please respond to those aspects  
>dealing with non-physical tracking skills off-line. I insist.

As I've pointed out, I think we need a more defined and workable definition here. Maybe it's just where I'm coming from but I have a hard time often figuring out what a non-physical skill actually is. "Spirit tracking" is certainly non-physical, although there are folks that argue that it is based on understanding of the physical. My response here, though, is simple- since I can't do it, I won't talk about it. Hows that? There are some aspects of tracking that require some shifts in perspective- i.e. visualization or role plays of animal movements for pattern and track analysis, visual perception techniques or other larger

awareness questions- that are certainly physical and are vitally important to the process of tracking, but may skirt the edges here a bit. I want to talk about this stuff for the same reason I want to discuss variations in bow or handdrill technique, hide tanning, plant uses etc.

Without a doubt a good obsidian point has incredible penetrating capacity. My point was, though, is the difference all that great that learning to "flute" a point would lead to total destruction of a species, especially given the reality of predator/prey relationships, energy expenditures etc.? An ancient hunter would still have to find and approach the prey. No matter how big a mammoth is, I can't believe it would be all that easy, but a person would never know that, unless they were out there in the woods trying it (obviously not on mammoths, but on other species).

Well, didn't NAT. GEO. do an article on how ancient man hunted large game?  
As I recall, it was not one person, but a whole BUNCH who would finally  
downed the animal.

Anyway, if I ever have to use some of the survival skills this list  
presents... I know I'll leave the mammoths, elephants, and such alone:)

Subject: A definition of tracking

Content-Type: text/plain; charset="us-ascii"

Status: U

X-Mozilla-Status: 0001

Hi Y'all

Good post Mark Z.!

For the purposes of this group, I'd like to work out a broad definition of  
"tracking". Much of what has been discussed about the topic has been done  
without an understanding of what tracking represents in our various  
intrepretations. I hope we can come to some concensus.

A place to start;

Tracking; following evidence of the passage of some person, animal or thing  
either by physical evidence left behind or by other existing physical

phenomena such as sight, sound, smell or vibration.

One thought. Our "brains" are incredibly complex organs. As we all know the brain has a way of processing stimuli that we are not consciously aware of. Often this stimuli is below some sensory awareness threshold but will manifest itself as a "feeling". I practice and teach techniques for enhancing our awareness of these subliminal stimuli. This is not "spirit tracking".

I took a weekend class from Paul Rezendes, author of "Tracking and the Art of Seeing" (ISBN 0 944475 29 9), an excellent tracking book that has tons of great pictures (he's a wildlife photographer) and is much more fun to read than Murie's book. I recommend both the

book and the classes.

He takes a group of 8-16 people on a semi-random walk through the woods near his home. He or his assistant may have gone out earlier that day to look for something interesting. He points things out and answers questions as he goes. For example: Stunted hemlocks, crazy twisted beeches (oak? already I'm forgetting), cut-off oak and hemlock branches, curious two-by-two tracks in a straight line, scraped bark on the less-steeply sloped side of a white oak, and little cashew-shaped scat, all of which indicate browsing by porcupine. How you can study the branching pattern of mountain laurel and hemlock to get a history of deer population over the last five years. Pits where great trees once stood -- a tree falls out of its grave, not into it, and the pit remains long after the tree has disappeared. How coyote, otter, and weasel like to leave their scat in prominent places. That scat diameter is more indicative of species than length or volume. Debris piles and stash holes of red squirrels. Bare patches under hemlock trees used by deer bucks to announce their presence in mating season. Small clipped-off buds on blueberry bushes that tell you how many rabbits are about. He also told us what not to look for: wintergreen, partridgeberry, and red cedar are not mammal food and tell us little about deer or rabbit populations. We saw so much scat I'm amazed I could ever walk through the woods without coming back with shit on my shoes.

Walking with Paul leads me to believe that seeing what is in the wilds is not a matter of increasing your "awareness", but of knowing what to look for.

He wasn't really interested in tracking down animals. He doesn't study minute details of tracks to try to follow a trail. He just needs a few tracks to tell him that a fisher was here yesterday evening, and he knows what the fisher was probably doing. He says the way to find animals, whether you are a hunter or a nature photographer, is not to know where an animal has been, but where it is going to be. Once he has looked over the patterns in the woods he can predict with reasonable accuracy who will be where when.

After the classes I took a walk in the Catskills, looking for any of the things he had pointed out. I was excited to find a strange, tubular brown scat, composed of woody bits in some sort of brown leafy wrapper. Paul says that scat scent is often the best clue to its origin, and it proved so in this case -- what I had was a stomped-on soggy cigar.

If you know someone who knows these sorts of things, then of course you don't have to go all the way to Masseursetts. I suppose you could gain similar knowledge from taking walks with anyone who spent a lot of time observing nature. But for those of us not lucky enough to know any such person, Paul's classes are great.

This is a good definition to begin with. I think it covers most of the bases I can think of off-hand. There are also other aspects that may or may not be covered here and they involve analysis and interpretation of sign or tracks to get a feel for what the animal is doing, how its moving or other similar things. Again, these are physical things and can be determined from such things as change in gait or in changes in pressure on the walls, floor or horizon of the track (again, the unmentionable teacher and other aboriginal trackers talks of macro and micro pressure releases. The micros are things I can see sometimes but can't interpret to save my life. There is also some controversy surrounding interpretive inconsistencies between TB and Australian aboriginal trackers. Therefore, I'd just as soon leave these alone. The macros on the other hand have verifiable physical reasons for why they are as they are. This seems like fair game to me)

I agree and feel that this aspect is at least as important as some of  
the other more obvious aspects of this art. Visualization is another  
aspect of tracking that is related here, as it has to do with feeding  
the subconscious mind and role playing certain aspects of an animal's  
movement, an important aspect of interpretation.

Thanks Ron!

Charles Worsham is the best by far. Tom Hanratty is another good tracker but he is in Wisconsin. He runs Medicine Hawk Wilderness Skills in Milwaukee (414)482-8722. Tom teaches animal tracking classes and classes on "forensic tracking" (using tracking skills in crime scene analysis etc.) also as he is a former medical examiner for Milwaukee County.

To go a bit further a field I have heard good things about Jim Lowry in California and a guy named John Stokes, although I don't have addresses or numbers for either. I can get them and post them on the list. Another good tracker on the east coast is Paul Rezendes. I believe he is located in New York (but I could be wrong about this). Paul is the author of "Tracking and the Art of Seeing". He is a photographer by trade. Another tracker that comes to mind that I would recommend is James Halfpenny. Jim is the dean of "scientific trackers" and the author of "Mammal Tracks of North America". He's good. Sorry I don't have addresses for any of these people other than Charles Worsham. For those interested, his address is:

RFD 4, Box 446 Thomas Rd.  
Madison Heights, VA 24572

Here in my area, trappers always use apples or carrots as muskrat bait. I was wondering if anyone knows what natural baits could also be used, especially in late fall or early spring. Thanks.

BTW, thanks to Phil Goetz for his recent post on the tracking course he took and to everyone else who have done a better job than I could at orienting this subject of interest. I'm sorry if I overreacted at Mark's insistence that this subject be discussed. I was suffering from the old french saying "Chat ÈchaudÈ craint eau froide" which tranlates to "Cat which has been scalded is now afraid of cold water". Tracking as defined is obviously a very valid subject for this list, since it pertains to "How-to" information on a useful skill.

Thanks to everyone for your excellent contributions. I'm sure I speak for all when I say that your lenghty and informative posts are much appreciated. Keep up the good work.

AndrÈ

One of my teachers knows him well and speaks very highly of him also. I also thought that the newsletter he publishes is one of the best I have seen. It tends to focus on his area in California in terms of plants, local history etc. but has had some great tracking articles. One in particular contained a picture of tracks that were found in some kind of soft rock that were obviously made a very long time ago by an adult and a child. The pressure releases were still there in the tracks and the question was asked: what were they doing when these tracks were made (in terms of body major body actions etc.)? Did anyone see that? More specifically, did anyone figure the puzzle out? I'm still working on it but friend claims he has figured it out.

Subject: deadfalls

Content-Type: text/plain; charset="us-ascii"

X-Mozilla-Status: 0001

Back in 1992, Jim Riggs wrote an excellent article on the history, construction and use of the Paiute deadfall in the Bulletin of Primitive Technology 1992:1(3):38-46. The photos and line drawings alone are worth the effort to get a reprint. What I found most interesting was Riggs' analysis of the traditional "figure 4" trigger configuration compared to his modified near horizontal lever position. He summarized the pros (+) and cons (-) of each in a sidebar thus:

\*\*\*\*CONVENTIONAL WISDOM\*\*\*\*

HIGH ROCK ANGLE

-Longer falling time when tripped, thus more time for quarry to react and escape

-Less % of quarry's body likely to be under rock

-More tenuous, unstable contact between rock and lever

-Taller fencing materials required

+Bait stick is shorter, choice of suitable materials is broader

+Friction contact between bait stick and rock is potentially easier to achieve

POST (ie, upright stick) POSITIONED UNDER ROCK

-When tripped, rock can begin its fall but actually land atop lever and post and remain upright

-tripped rock can begin to flip lever and post away but because of its high angle and thus sluggish

star, only knocks them over, often resulting in base of post remaining

under front of rock thus blocking its complete fall

#### DIAGONAL "FIGURE 4" LEVER POSITION

- Requires a carved "no slip" coupling between top of post and underside of lever
- As mentioned above, high rock angle means less contact area between lever and rock resulting in less stable set
- +Cordage does not tend to slide up post

#### \*\*\*\*\*RIGGS' SUGGESTED SET\*\*\*\*\*

##### LOW ROCK ANGLE

- +Quick falling time when tripped. Rock to quarry contact almost immediate with little time to escape
- +Quarry must be mostly under rock to reach bait, especially with adequate fencing
- +Potentially broad and stable contact area between lever and rock
- +Shorter fencing material required
- +Bait stick normally must be longer, thus strong spine more critical
- Friction contact between bait stick and rock can be more difficult to achieve

##### POST POSITIONED IN FRONT OF ROCK

- +Rock cannot abort its fall by landing on top of upright post
- +Rock nearly always flips lever and post beyond path of its fall

##### HEAR HORIZONTAL LEVER POSITION

- +Specifically shaped coupling between top of post and underside of lever can be advantageous
- +Increases surface contact between top end of lever and rock so more stable set
- Cord may want to slide up post (Normally corrected by roughening post surface or slightly adjusting angles between lever, cord, and post).

To add credence to these ideas, there is a photo in the book Survival Arts of the Primitive Paiutes (Margaret M. Wheat, University of Nevada Press, Reno) that shows a deadfall set exactly as Jim suggests. Also, the upright looks to be at a 45 degree angle rather than perpendicular to the ground.

I've built dozens of figure 4's (none for real). The kids like to set them up in the livingroom with cushions as dead falls. I've always wanted to talk to someone whos had success with this trap. Do you find it lethal? Have you had much success with this particular trap (or for that matter has anyone else?) If so what are some of the secrets (mine always seem so slow, and its difficult to get enough weight on top)

Subject: Re: Figure 4 Dead fall

Content-Type: text/plain; charset="us-ascii"

Status: U

X-Mozilla-Status: 0011

Hi Kelly

We use figure 4's to take marmot, gophers, squirrels (after we've determined that there are no protected species in the vicinity) rabbits and just about everything else that flies, crawls, jumps and represents food. They work very well when correctly set.

There are several carving tricks we use to "sensitize" the triggers. I'm a little at a loss for a way to describe them. We will be showing the entire process in an upcoming video. Meanwhile. To speed the drop of your deadfall it is good to place the grounded end of the weight on a pivot/bearing surface of some sort. A heavy rock or log tends to dig into the ground. This slows the fall of the weight. Place another bearing under the upright to keep it from digging into the ground. The proportions of the figure four need to be proper for the trap to activate correctly. A good test of the proportions: The "set" with a trap will throw all of the pieces free of the weight.

Many of the books show a Figure four with "bait". Eat the bait yourself and try this. Cut the trigger notch in the upright so it is close to the ground. Run a trench in the ground with your finger, where the trigger will be. The trigger should only be about 1cm above the ground. Place small twigs, grass etc. over the trigger. The animal will trigger the trap when it walks through. This is called a "treadle" trigger. To ensure that the animals feet are in the right place at the right time, we use "timing sticks" to put them there.

The VC used these on us with good effect. Essentially they just placed a log, stone, body or some such obstruction in the path. You naturally alter your stride to step over the object. This places your foot in the right place at the right time. Animals are equally vulnerable to this.

Almost all of our figure fours are made with willow and discarded after they've been successful. Animals smell the crushed gook on the traps. Once you know the carving tricks it takes about five minutes to fashion a good figure four from one piece of willow.

If you are trying for larger game..... coyotes and feral dogs come to mind. You may have trouble lifting the deadfall. In this case you can build a pile of stone on a primary rock once the trap has been set.

Our figure four sets are running about 25% at the moment. This means that if you have good sets in four locations, one of your traps will be successful.

Snares are another story.

Then there are foot traps.

and twitch ups.

and my favorite (Naturally) the Hood Lunch Launcher. (a student named it after I invented it.... I gave him an "A" in the course.)

BTW. We don't make much pottery as the soil is often too poor. Jungles, Sierra, etc. We cook in the animal skins. They are much easier to tote around, serve as hats, water buckets and just about anything else you need a bag for. The Tubatulabu cooked in baskets that also served as backpacks. Go figure.

A great way to practice the triggering aspects of figure fours and  
piaute traps is on your pets. I have one of those plastic milk carton  
boxes that you can steal from behind the grocery store (not that I did)  
and use it as the deadfall. I trapped my cat fifteen times in a row one  
night using pepperoni as bait. (I never said my cat was smart) It  
helped me work out angles and weights and trigger elements. Also my  
daughter's pet gerbil (I know - illegal in CA ) was regularly getting  
out of the cage and escaping into the kitchen. I used a Tupperware tub  
upside down with a piaute and some grain as bait. Caught her everytime.  
Used a very tiny version mind you, only lifting the tub about two  
inches, but it is a dynamite trap! Practice with lots of stuff, but you  
don't even have to kill to get some good experience. Most pets fall for  
it everytime and all you do is piss them off a bit. (My cat was always  
indignant, but came back in for more ten minutes later)

Kevin

I've had great success in winter trapping rabbits. The best set was several boards nailed together making a rectangular shaped piece about 2' x 3' which was then weighed with stones, maybe, 3 times a rabbit's weight. The trigger was carved from appropriately sized sticks. I think I mainly used sassafras. I used apples with peanut butter as bait and sprinkled cider around the trap. I know, its not pure survival, but I was just a kid and I caught lots of rabbits!

Another thing, a few year back in the Journal of Primitive Technology there was a discussion about the configuration of the trigger sticks with the Paiute trap. Seems that the trigger is faster if the diagonal is nearly horizontal rather than at 45 degrees like the figure 4. If this is not making sense, I can post the original description from the journal.

Does pretty good job on squirrels. My experience is that with bigger

animals that require more weight on the deadfall, a paiute is a better choice.

>Have you had much success with this particular trap (or for that matter >has anyone else?) If so what are some of the secrets (mine always seem >so slow, and its difficult to get enough weight on top)

What are you using for a deadfall? Have you tried making a pathway for the deadfall by pushing 2 sticks into the ground on either side for support (be careful that there aren't places on the sticks that the weight can hang up on).

Figure 4s can be "hair triggered" fairly easily by playing around with the angles on the notches and setting them just on the tip. Also, avoid live materials in the winter time as they do freeze up on you. I learned this the hard way by having a "magical, bionic" snowshoe hare snatch bait from several traps without tripping them and then breaking the deadfall in two on the one that he did trip. This embarrassing fiasco has lead to a string of northwoods legends about 10 foot tall "killer hares" :-). Needless to say, we tried a different approach next time, but hey, that's how you learn, right?

Another hint is to make sure you have a solid "wompin'" surface under the deadfall such as a rock or other solid object. I've never tried it, but I would imagine that having their head puched into soft sand, mud or snow by a deadfall would do nothing but irritate a potentially trapped critter ( and who wants to piss off a 10' tall, killer rabbit, right :-))

Happy trappin',

Mark Z.

There's been mention of a "paiute" trap similar to the figure four here. Is this the one that uses a bit of cordage? If not, I've got pictures of another to put up on my web page. It's from "Survival Arts of the Primitive Paiutes" by Margaret M. Wheat ISBN 0-87417-048-6.

Someone asked about cordage. Peek at <http://www.midtown.net/~merv/mropwalk.htm> There's a couple of ideas there.

And again, if there's anything that needs web space, I can move stuff around and set it up at midtown.net. I would like to see a deadfall, especailly figure four, and snare or maybe just a general trapping page attached to this promitive skills group. I'd need pictures, sketches, etc. I do draw flies, but I'm not an artist.

Hi AZ,

To catch a snowshoe hare here in Quebec (probably the same elsewhere), find a trail and walk BESIDES it until you find a spot where the trail narrows between two trees so the animal has no choice but to follow that spot. Set your wire snare so the loop is such a size that your closed fist fits through it. Set it three fingers above the ground.

Some tricks:

Rub the wire around a branch before making the loop and it will stay round much more easily.

On moon nights, place the snare under evergreen trees so it is in the shadows.

Light a piece of birchbark under your snare to darken it.

Place your new snare wire in a warm oven for a couple of hours to tarnish off the brightness.

A very fine dry twig placed vertically under the snare will prevent the animal's head from going underneath.

A dry stick placed at a 45 degree angle a couple of inches above the snare (as if it had fallen there), will prevent the animal from jumping over the snare.

Wrap the other end of the snare wire around a branch at least two times for strength, and fairly close to the loop. You know it's right when

you move the snare a couple of inches and it springs back into place. The easiest way to do this is to wrap the snare around a dead branch while you are standing and then to stick the branch in the snow or ground besides the trail.

Now without snare wire, it's much more difficult...

Hope this helps, it's a start.

Jack,

Check out Wilderness Way Online. They have placed some of their nicely illustrated magazine articles on the internet. For instance here are the particular page addresses for:

"Finding Direction"

<http://www.pioneerpc.com/wildernessway/direction.html>

"Snares"

<http://www.pioneerpc.com/wildernessway/snares.html>

.....

Another good source for trapping info is a magazine called FUR,FISH,GAME they have several advertisers that sell nothing but traps, and trapping

info, most of it modern, but some of the older stuff is in there also. There was one advertiser that sold reprints of the older trapping guides including snares. Also Ragnar Benson's books SURVIVAL POACHING and LIVE OFF THE LAND IN THE CITY AND COUNTRY both published by Paladin press. Paladin press also publishes a book called INTO THE PRIMITIVE that is a guide to trapping for survival. I don't have a copy, and have never actually held one, but it is supposed to have primitive trap building. Paladin's catalog is available for \$2 at P.O.Box 1307-7a1; Boulder, Co. 80306 or 1-800-392-2400 for the USA and Canada. They also have a web site at <http://www.paladin-press.com> and no I don't work for Paladin;-), but they do have some interesting selections.

>

>--John

John,

I have not yet done a lot of work with "no-carve-'em traps", but so far I have had results comparable to what I was getting with conventional traps (+/- 15%). (I haven't focussed too much on trapping yet.) My experience is limited to deadfalls, and I simply pick up and stack sticks and rocks in unstable forms (each one is different). It is helpful to have some prior experience with regular traps so you understand what needs to occur. I have found that this "non trap" method saves a lot of time that is otherwise expended manufacturing, transporting, and repairing traps.

I've been systematically working back through each skills area over the last few years, and do not expect to focus on traps again for another two or three years, but when the time comes I will do a very thorough study of the non-trap idea, and will certainly publish the results in some form. Meanwhile, input would be greatly appreciated from everyone.

Always Peace,

Thomas J. Elpel

I have not personally trapped muskrat so take what follows with that in mind:

Muskrat are primarily vegetarian. In the marshy areas of the southeastern US their primary food is cattail, bulrush and other marsh plants. Cattail seems to be the predominant favorite. They will eat the stems leaves and rootstocks of these marsh plants.

I was taught, and found it to be true in my experience, that you look and see what plants in an area are an animal's favorite but there are not many more of which that are left in reach or in range of the animal. Here is where your tracking skills come into play: knowing how to track an animal to its feeding areas, what its chews characteristically look like, examine its scat, etc. Once you know they have a preferred food that is getting harder for them to obtain, you harvest some of it for them, nice little animal trapper that you are, and place it in a very convenient place for them to munch, i.e. use it for bait.

Hi Folks - I'm new to the list. Regarding rat trapping, most of it is done with no bait at all. Muskrats wear trails that are easily visible and dig den holes in the banks of waterways/ponds/lakes. They are easy to catch by placing traps in travel lanes. Baiting does work though. Just about any vegetable matter is good with corn on cob, apple, and carrot being my favorite baits. I do nuisance wildlife control work as a sideline and about the only time I bait is when the customer wants the animal caught alive in a box trap.

I also would very interested in such baits. Here in the Midwest we use either carrots, or my personal favorite, parsnips. How do you lure in some critter whose diet consists of tree bark? (softwoods) I personally think the food-bait is a tough case. Would scent from other rats be natural? Unless someone posts otherwise, I think the best bet for trapping 'rats' in a survival situation would be to rely on run or blind sets. Probably 50% of rats taken aroun here are in blinds.

I know this didn't help, but I had to reply because it is a great question. Most other "trappable" animals would be attracted by some sort of natural lure.

I have baited an area before also to get an idea of what an animal is eating. I drive pointed sticks in the ground with the bait on them, several different kinds of bait on different sticks. I observe after awhile what bait was munched and bait my traps with this. I must confess, though, that I still have a lot to learn when it comes to trapping. I'd love to spend some time with some trappers.

Hi all,

The reason I am so intested in muskrat habits is that this particular animal is without doubt one of the most important survival foods. It is extremely abundant just about anywhere, fairly large, and especially, it is fairly fat and therefore calorific. This animal is near the base of the food chain and not too intelligent. Sounds like all the criteria for survival food...

Any further tips or tricks on capturing this animal in survival situations would be appreciated, as would be references.

AndrÈ

PS I much prefer eating the musk part of the animal rather than the rat part. Many students will eat them when I call them swamp rabbits and won't eat them when I call them rats. They are delicious, by the way.

Andre, You WOULD NOT enjoy eating the musk part!!

Actually regular old rats are good for food too. They were esteemed here in Baltimore, Md at Fort McHenry during the war of 1812 by the prisoners of war. Cats, Rats, & Dogs Cookbook was written here during that time as well. (Hahahahaha!!) Just kidding! However during wartime sieges all

over the world, the common rat, cat and dog have provided nourishment to the hungry. I've never eaten a common rat (and hopefully never will) , but I have eaten muskrat often and enjoy it. It is pretty plain so i normally eat it ground up in a curry. Never have tried barbecuing yet though, will be soon.

It is a very stupid animal in general and is suckered in by just about every trick in the book. Most of my trapping is done with conibear traps set in their "runs" in the water or near their den holes. They do build large vegetation mound dens, but they also dig holes into the banks of waterways. (Beaver do the same thing). The easiest way of catching them in a survival situation would probably be with a snare set in their runs. Their runs can be found under ice by looking for bubble trails under the ice. I'm not sure of this, but if you stalked up VERY carefully to a vegetation mound and thrust a spear into it you might hit one in it's den - probably take a good amount of pure luck to be successful though. Any book on trapping would give you many ideas as to what could be done in a survival/primitive situation.

TTFN,

I NEVER had to trap for fur, but my Dad and Uncle leased land in South LA to trappers many years ago. If they had not served during WWII(they'd have become very, very rich selling raw fur for mil. use.)

Even in the 50s mink, muskrat, coon, were trapped. I've enjoyed my share of muskrat meat...dark. But teenagers will eat just about anything.

As for eating the musk part....Andre' you were joking, for sure!

As I recall m'rat traps were not baited, and were placed along travel paths(as has been stated already).

Neutra(not spell right,sorry) were a big problem and tended to force the

m'rats out...these could also be eaten; I never did. They were/are considered a "trash" animal(to the fur trappers).

If the rats are fairly abundant in the area you're working, I have  
a method that has worked for similar game.

Ironically, I stumbled upon this technique because I was NOT in a  
wilderness area. The area was away from town, but was subject to  
many hikers and walkers. A small feeder creek ran into the Mississippi  
river and I had seen fresh mink tracks there. ( at the time, 20 yrs ago,  
mink brought in a pretty good price)

So I wanted to:

1. Place a trap that wouldn'tr be seen by dozens of people.

2. Use a drowning set for reason of item # 1 and out of humane concerns.

I have used drowning sets for all local water-dwelling furbearers ( coon are  
trickier to drown) Usually the weight of the trap is enough to drown the  
smaller critters i.e. rats, mink.

What I did was set a snare (metal one, sorry) in a prime run area. To it I  
tied a rock about the size of a softball. After two days I had a fine mink  
waiting for me in about 3 ft of water, out of life and out of sight!

Even with natural chordage, this application should work for rats.

>the food chain and not too intelligent. Sounds like all the criteria

True, the rat is lowly, but quite interesting. One buddy of mine hooked  
one ice-fishing and had it come thru the hole into his small tent. He has  
had a different outlook on the rats ever since. He also has some nice  
souviniers (scars).

Good day,

A while back someone asked about about Ragnar Benson's books. In his LIVE OFF THE LAND IN THE CITY AND COUNTRY he says "Muskrats, despite the name, are excellent eating. They can be caught in quantity, the skins are used to make vests or gloves, and the flesh consumed with relish. They are definitely my favorite small game 'eatin critter' "

I am wondering if the fat of the muskrat will supply the essential fats

that, say, rabbits cannot. Anyone knowledgeable on the survival sources of these essential fats?

Rob Chatburn

>I wonder if nutria are as good as muskrat? Maybe the Boomerang man would >know.

NO, I can't say I've ever eaten. BUT.....my local pastor(when much younger) Yea, it's nutria...now I remember...

Asked me if these were ok to eat. I told me sure. He went and shot a bunch, left 6 GIANTS on my back steps....looked like super-sized rats. Fortunately they had gotten still and my wife trashed them.

Now to be discouraged, he served a meal to all the surrounding priests one night, called it his BAYOU DINNER. One priest was not amused, once he discovered he was eating nutria. yea, and my priest-friend sent a couple to the bishop(who did enjoy them).

Not much about survival(in the wild), but maybe of some humor, none the less.

If it is acceptable to anyone here who traps or hunts, I would pay the postage for animal heads to be sent here- I would use them for preparing skulls for nature demonstrations

I'd appreciate any replies.

This is off the Thrower subject, but I've got 25 cents worth of remarks on hunting and gathering life, and I want to pass them on.

I forget which 18th.-century philosopher described early man's life as "Solitary, nasty, brutish, and short," but he was only repeating the accepted wisdom of that day.

Now we know a little more about Stone Age living. Nasty, brutish, etc. -- well, no doubt sometimes. But solitary? Never! As far back in time as we can look, we find humans living in groups, and with the exception of the orangutan, there are no other great apes that live as solitaries.

Even the most accomplished Stone Age hunter, even in country that was full of game, would have a hard time feeding himself without companions. While the women and children were gathering plant food (and sometimes bopping a rabbit or possum that came handy), the men were out in groups, collaborating on the hunt for big game. Sometimes, the whole band would cooperate to drive game. I can recall how much easier it was to hunt deer, even with rifles, if one or two men slowly moved through the brush, pushing the animals gently (they don't taste good if they've been frightened) past another one or two men who had taken a stand downwind. Collaboration, not solitary striving!

All this is just to say that primitive survival entirely on your own is a much tougher proposition than surviving

in a band of forty to sixty people.

People is people, even with the knowledge of how to make everything you need to survive from scratch, you still have to add the psychological aspect. "Do I want to survive? Am I flexible enough to apply my knowledge even though all of my food stocks are destroyed, many of my family and friends killed, my way of life ripped apart?" Many people just cannot accomodate misfortune on such a grand scale, nature mercifully takes them out one way or another. Technology has tampered with nature's way of survival in her element. We encourage people with defects to live by artificially giving them what nature did not. Civilization and community also allow us to support the weaker elements in our communities, the old, the sick, etc. In any mass catastrophe most of them will die, no matter how knowledgable they are. Harsh? Yes? We tend to glamorize the native peoples of America because they were well adapted to their environment, better in fact than most of the invaders from Europe. Still people is people, shock numbs the mind for a while. You still have to jump start your head and look beyond what happened to what you need. That's what this group is all about. Knowledge will make a difference and can affect your psychology. Knowing

that you can build some sort of effective shelter without a Home depot, start a fire without a match, find food with out an Albertsons or Piggly Wiggly, defend yourself without Smith and Wesson, can make the difference in your confidence level. Some people can choose to go naked into the wilderness, and survive quite well. Yet if you took them forcably from their families and community, stripped them naked and dropped them miles away form any community or support, not knowing what happened to their families would they be able to get their head on straight soon enough to make use of the knowledge they have? Probably, but maybe not. Well enough of this. Just my two cents worth.

Good question. Depends greatly on the territory. In the north around Hudson Bay, it is a very large figure, somewhere between 10 and 100 square miles per person. I get this from the book Strangers Devour the Land.

One figure I have heard for wolves is 10 square miles per wolf. This figure comes from studies in northern climates, since there are very few wild wolves left south of Canada. The figure might be smaller for humans since they are omnivorous, or it may be bigger since humans are bigger, and cannot digest as large a percentage of any animals they kill.

I have yet to have a "typical" primitive day on an outing, but I'll give average (and wishful thinking) times for each.

day 1: get lost :-) This is the easy part. If I go out in the morning, I'll using track an animal for awhile. Along the way I'll pick up anything that may be useful (throwing stick, plants/rocks/materials for traps, etc). At the Adv. Standard Survival TBjr course, Tom mentioned to make a travois to carry all of this stuff. He also mentioned to pick off a few squirrels/small game along the way. I'll keep my eyes out for a good shelter location (water source nearby, good debris, high and dry, good firewood, etc). Once found (could be 1/2 day to find), I'll start making a debris hut (4-8+ hours). If it's warm weather, I'll make it just to get thru the night, and then start on fire. If it's gonna be a cold night, I'll just concentrate on the shelter and do the fire the next morning. Usually after dark, I'll have the shelter in good shape, and a stack of firewood and rocks that I found while making the shelter, and will start on the tipi style fire. If I was able to find something like a mullein stalk, I'll do a handdrill. If not, I'll make a wood bow fire drill, and then make cordage (4-8+ hours). I once made enuff cordage from cattails in about 4-6 hours. It broke 3 or 4 times before I got a coal. The original lenth was 42 feet long, and then I doubled it 3 or 4x for strength. I haven't tried my belt, shoelace or piece of clothing yet, but they would be an option if needed to speed up the time involved. If I get the fire going this night, I'll start burning some bowls out of pine logs, so I can boil water. Tom mentioned making dirt mounds to channel the wind to "blow" the bowls, so you could concentrate on making traps. I get very parched if I have to blow them by mouth and have no water (I once got very dehydrated doing this with a cool beaver log (not to be confused with a "steamer"). I thought it would make an awesome looking bowl. It turned out to be a hardwood, and it was very hot outside. My mouth felt like a lump of dry wood chips by the time I was done blowing it) The beaver bowl now resembles a chipmunk canoe and my daughter uses it for her dolls and floats them down one of our streams! I did get it so I could finally rock boil water in it. If I find a large birch tree (or similar) I'll make a bark basket for boiling water. With pine, I can get a good size bowl for water and stews in about 2 hours. If the fire is going, and I got some small game or plants, I'll eat. if not, time for bed...

day 2: If I got all of the above done (uusually not), then I'll start setting traps. In the morning, go around and lick dew (or sop up in a bandana or tshirt). Usually I'm just getting a fire about now if I have to make cordage. I'll finish making the bowls to boil the water

(even if I found a spring or a seep) and trap sticks. Also some snares if I have lots of cordage plants. Most of this day is spent adding more debris to the shelter, getting the fire/bowls, cordage and traps sticks done. Also finding wild edibles, or making teas when I need a break from other camp duties. I can usually (well, most of the time) have a fire by day 2, a great shelter, some food, and start to get good water. If there is a good supply of tall grass or ferns, I'll make matts, sleeping bags, coats, door for shelter, if needed.

day 3: Collect morning dew. Finish anything not done above and set a trap line (or another if I set one yesterday) around noon. I have just returned from being a vegetarian for almost a decade to eating meat, so this part is new to me. I have tried to just live off plants, but have realized that you can't. I've been practicing my throwing stick, and getting good, so I'll now incorporate this and traps into my outings. Start workg on a "shed" or work room. This is either a seperate dwelling, or an extension to the debris hut. By now, life should be a party (but I'm usually not there yet). Day 3 is where I start to have a good supply of water, start to eat more and start exploring. Each time I got out I'll keep my throwing stick with me for food, keep picking up plants/rocks for knapping, etc. I'll start to check my traps 1x day around noon and keep setting a new trap line, until I have about 4 good lines out there. In theory, all I have to day from now one is to spend 2--3 hours a day checking the traps, going hunting with the stick and the rest is free time. Some day I'll make it this far by day 3! IF the weather is nice, then the above outline can be followed fairly close. If it's raining, then I'll spend alot of time in the shelter or work room making things, or resting to conserve energy. At least there is plenty of water! This could push the whole schedule back several days depending on weather. If it's black fly season, then its really difficult!

Approx times for making stuff:

Shelter = 8-12 hours (best time is about 4 hours for summer shelter)  
Fire = 4-12 hours (best time is about 2 hours w/handdrill, 1 hour if I have brought cordage)  
bowls = 2-4 hours (best time is about 2 hours with ideal wood for a stew sized bowl)  
birch bark bowl = 30 min.  
making traps = (approx 20 -30 min for a figure 4 or Pauite type trap with ideal wood)

Hope this is helpful. I don't have it down 100%, and there is always some unexpected

variation

(like no plants for cordage easily found, falling thru ice, etc) but each time out makes it easier the next time. The first few times were very difficult, and I thought that the last day would never come (or I bailed and came out early). One time after getting dehydrated, I got extremely upset when my wife dropped a waterbottle and a little bit spilled. We were only 5 min. from our house and just going for a walk in the woods, but after going without for so long, you really appreciate it more when you have it and realize how precious it really is.

Subject: Colorado Wild edible help

Content-Transfer-Encoding: 7bit

Content-Type: text/plain; charset=us-ascii

Status: U

X-Mozilla-Status: 0001

Hi,

I have recently subscribed to this list and think that there is a lot of good information that is passed around. I have been serious about learning wilderness survival skills for the last three years and because of that interest, I have my scout troop working towards a week long wilderness survival high adventure this summer. We are based in Longmont which is just northeast of Boulder 15 miles.

One of the areas that we need the most help on is with wild edibles. I have Peterson's guide and a Rocky Mountain guide but am interested in still more sources of information. If anyone would be willing to do a field trip or know of someone that would like to do a field trip with either my whole troop or just myself and the other scoutmasters I would really appreciate it. Sometime in may or June would probably be best for a field trip as our trip is currently planned for the third week in July. I am also interested in any other field guides that are skewed towards identification and uses for this area.

We are planning on about 50% of our food coming from foraging. Part of the equipment list for each boy is going to a sock full of whole grains and legumes. We hope to catch fish and also setup non-lethal snares. As leaders we will have a small supply of spices, meat, flour and honey to supplement the food. For example if the boys set up a snare or deadfall on a run and an animal triggers it ( the snares will be dsigned so that the loop will break as it tightens and the deadfalls will have a stopper stick) then they will get some meat to throw in their evening stew. A few of the boys have caught trout by hand and all of them have at least touched a trout and made an attempt at catching one.

Also if anyone has good methods for cooking without pots, I would be interested in seeing some posts about them. I have done ashcakes, tortillas on hot rocks and raosting on a stick but have not tried any pit steaming or things like that. We will be taking one big pot along with us but I would like to do at least one day without using the pot.

Thanks.

Hi all,

I am sending you this article in the hopes of starting a thread of discussion about "nothing". The rest of my letter is posted at the end of the article.

The Art of Nothing  
by Thomas J. Elpel

Westerners who first met the Shoshonean bands of Indians in the Great Basin Desert typically described them as being "wretched and lazy". Many observers remarked that they lived in a total wasteland and yet seemed to do nothing to improve their situation. They built no houses or villages; they had few tools or possessions, almost no art, and they stored little food. It seemed that all they did was sit around and do nothing.

The Shoshone were true hunter-gatherers. They spent their lives walking from one food source to another. The reason they did not build houses was because houses were useless to them in their nomadic lifestyle. Everything they owned they carried on their backs from place to place. They did not manufacture a lot of tools or possessions or art, because it would have been a burden to carry.

We often expect that such primitive cultures as the Shoshone must have worked all the time just to stay alive, but in actuality these were generally very leisured peoples. Anthropological studies in different parts of the world have indicated that nomadic hunter-gatherer type societies typically worked only two or three hours per day for their subsistence. Like the deer and other creatures of the wild, hunter-gatherer peoples have nothing more to do than to wander and eat.

The Shoshone had a lot of time on their hands only because they produced almost no material culture. They were not being lazy; they were just being economical. Sitting around doing nothing for hours on end helped them to conserve precious calories of energy, so they would not have to harvest so many calories each day to feed themselves.

Today many of us westerners find ourselves fascinated with these simple cultures, and a few of us really dive into it to reproduce or recreate the primitive lifestyle. In our typical western zeal we get right into it and produce, produce, produce. We work ambitiously to learn each

primitive craft, and we produce all kinds of primitive clothing, tools, containers, and art, and just plain stuff. True hunter-gatherer cultures carried all their possessions on their backs, but us modern primitives soon find that we need a pickup truck just to move camp! In our effort to recreate the primitive lifestyle we find that we have ironically missed our mark completely-- that we have made many primitive things, but that we have not begun to grasp the true nature of a primitive culture. To truly grasp that essence requires that we let go, and begin to understand the art of doing nothing.

Understanding the art of nothing is a somewhat challenging concept for us westerners. When we go on a "primitive" camping trip, we take our western preconceptions with us. We find a level spot in a meadow to build our shelters, and if a site is not level then we make it so. Then we gather materials and start from scratch, building the walls and roof of a shelter. We do what we are accustomed to; we build a frame house on a surveyed plot in the meadow. Then we gather materials and shingle our shelter, regardless of whether or not there is a cloud in the sky, or whether or not it has rained at all in a month.

Part of the reason we act this way stems from our cultural upbringing. Another part of it is simply because it is easier for those of us who are instructors to teach something rather than to teach nothing. It is much easier to teach how to make something than to teach how not to need to make anything. The do-something approach to primitive skills is to make everything you need, while the do-nothing method is to find everything.

For example, the do-nothing method of shelter is to find shelter, rather than to build it. Two hours spent searching for a partial shelter that can be improved upon can easily save you two hours of hard-working construction time, and you will usually get a better shelter this way. More so, the do-nothing method of shelter is to look first at the incoming weather, and to build only what is needed. If it is not going to rain then you may be able to do-nothing to rain-proof your shelter. Then perhaps you will only need to put your efforts into a shelter that will keep you warm, instead of both warm and dry.

There are many things, both small and large, that a person can do, or not do, to better the art of doing nothing. This can be as simple as cupping one's hands to drink from the stream, instead of making and carrying a cup, to breaking sticks to find a sharpened point, rather than using a knife to methodically carve out a digging stick. Hand carved wooden spoons and forks are do-something utensils that you have to manufacture, carry, and worst, that you have to clean. But chopsticks (twigs) are do-nothing utensils that do not need to be manufactured or carried, and you can toss them in the fire when you are done.

Henry David Thoreau wrote of having a rock for a paperweight at his cabin by Walden pond. He threw it out when he discovered he had to dust it. This is the very essence of a do-nothing attitude.

The do-nothing approach to primitive skills is something that you do. Doing nothing is a way of saving time and energy, so that you can finish your daily work more effectively. One thing that I have found through the years of experimental research into primitive skills, is that there is rarely enough hours in a day to complete all of a day's tasks. It is difficult to go out and build a shelter, make a working bowdrill set, set traps, dig roots, make bowls and spoons, and cook dinner. Hunter-gatherer societies succeeded in working only two to three hours per day, yet in our efforts to reproduce their lifestyle we end up working all day.

Doing nothing is an approach to research; it is a way of thinking and doing. For instance, I do a lot of timed studies of various primitive skills: i.e.: how long does it take to construct a particular shelter? How much of a particular food resource can I harvest per hour? Can I increase the harvest using different gathering techniques? One thing I have noted is that it is only marginally economical to manufacture common primitive deadfall traps. It is time intensive; it adds weight to carry, and the traps often have short life-spans. The do-nothing alternative is to use whatever is at hand, to pick up sticks and assemble them into a trap, without even using a knife. Preliminary tests of this "no-method" have produced results equal to conventional, carved and manufactured traps, but with a much smaller investment of time.

Primitive hunter-gatherer type cultures were very good at doing nothing. Exactly how well they did this is difficult to determine, however, because doing nothing leaves nothing behind for the archaeological record. Every time we find an artifact we have documentation of something they did; yet the most important part of their skills may have been what they did not, and there is no way to discover what that was by studying what they did.

Nevertheless, what you will discover for yourself, as you learn the art of doing nothing is that you are much more at home in the wilderness. No longer will you be so dependent on a lot of tools and gadgets; no longer will you need to shape the elements of nature to fit our western definitions. You will find you need less and less, until one day you find you need nothing at all. Then you will have the time on your hands so that you can choose to do nothing, or even to go do something.

Hi all, (letter continued)

After many years of trying to do something in primitive skills I realized that maybe I was going about it all wrong--that the essence of primitive living was to endeavor to do nothing. I used to have lots of primitive possessions to display around my shelters and office when I was doing lots of something, but now they are wearing out and not being replaced, because of this new direction in primitive skills. I am discovering that as my skills improve I have less and less to show for it. One idea that is not included here is the "sticks bow" an instant bow made from a bundle of small-diameter sticks (I read about in a flyer from John and Gerry McPherson.) What other ideas does the group have about nothing? Any advice would be greatly appreciated. Thanks.

Always Peace,

>True hunter-gatherer cultures carried all their possessions on their backs, but us modern primitives soon  
>find that we need a pickup truck just to move camp!

On May 11th my wife, two daughters (aged 2 and 5) and I are embarking on a 12 month walkabout to Hong Kong, Malaysia, Thailand, Vietnam, Indonesia, Australia and New Zealand.

One of our primary concerns is what to take and how to carry it. We have finally decided that I'll carry the youngest in a kiddie-carrier and my wife will carry our possessions. We've limited ourselves to just 40 litres of backpacking space. Needless to say, our possessions will be meagre at best (one shirt each, one pair of pants each, undies, rain gear, medical kit). Instead of bows and spears, we'll be armed with Mastercard and Visa.

Not quite the hunter gatherer of old, but I'm intrigued to find out how we'll manage with so few material items.

>The reason they did not build houses was because houses were useless to them in their nomadic >lifestyle. Everything they owned they carried on

their backs from place to place.

>They did not manufacture a lot of tools or possessions or art, because it  
>would have been a burden to carry.

Interestingly, all of our hard earned household possessions (furniture, beds, electric can-opener and so on) have become an encumbrance to us. What we used to think of as a desirable item, we now consider a pain in the butt that we somehow have to ditch or store.

>few of us really dive into it to reproduce or recreate the primitive lifestyle.

>In our typical western zeal we get right into it and produce, produce, produce.

One of the reasons we chose to bug out of Canada is to establish a lifestyle of time-richness, rather than material richness. Clearly this lifestyle is only temporary and is somewhat artificial but I think the experience will be very rewarding.

I worry a little about the kids - safety, health and education, but one of my favorite sayings is "If you want to bring up extraordinary children, you have to give them an extraordinary childhood", so I'm now putting my money where my mouth is.

This list server and the teachings of a number of people have given me the confidence that I can survive most things. I can now light a fire with very little effort (12 months ago, my idea of fire lighting was a tyre and a gallon of gas), I've take a wilderness first aid course so that I can deal with most medical disasters that may strike, I know how to establish a make shift shelter, purify water and gather food. So although I may never actually live the life of a pre-contact native indian, at least some of their wisdom has been passed on to me so that I can better enjoy and explore the modern world, and perhaps experience a glimpse of the time-richness of their life style.

Good thread Tom!

Regards

WHICH REMINDS ME OF THE YOUNG COUPLE(years ago) WHO WROTE TO ME FOR MY  
BOOMERANG catalog. They expressed that when they married and moved to  
Alaska, they wanted to do everything as primitive as possible. They  
thought a boomerang would be the perfect primitive hunting tool.

Along with my catalog, I sent a letter and told them straight-out that  
even with modern gear, they would have a tough time surviving in Alaska.

A walkabout is certainly exciting, but with such young kids to care  
for....

>we'll be armed with Mastercard and Visa. <

During the Gulf War, I was really surprised by some of the mail I  
received.

Troops placing Christmas orders directly from the battle fields and using  
their credit cards...Credit Cards on a Battle Field....? Modern warfare  
had come a long, long way!

Neal,

The most scientific study I am familiar with regarding labor in hunter-gatherer cultures was conducted with the !Kung people in Africa in the 60's. Less formal observations of the Great Basin Paiute Indians in the 1800's and of the Australian aborigines seem to confirm the "laziness" of true hunter-gatherer societies. I highly recommend reading Peter Farb's 1968 book "Man's Rise to Civilization (as shown by the Indians of North America from primeval times to the coming of the industrial state) (I thought some of my books had long titles!!!) Anyway, Farb's book is a really well written perspective on cultural evolution.

I would like to make a note of clarification: The !Kung work 2-3

hours per day for "subsistence" (food). The average person in our culture spends considerably \*less\* time working for food and much more time working for everything else. (I spent a lot of time developing this idea in my "Field Guide to Money", and no, "Money" is not a misprint.) When all work is factored in (cooking, shelters, tool-making etc., the !Kung work approximately a 40 hour week, BUT please note that when all our work is factored in (cooking, shopping, commuting, cleaning house, doing laundry etc.) we moderns average about 80 hours of work per week.

Always Peace,

Tom's post on this brought back old memories, a scene in a movie that I've always thought very profound...

I was but a young lad of 15 or so when the movie Lawrence of Arabia

came out. A good flick, but too long and slow for me at the time. Nevertheless, there was a scene I've never forgotten, and crops up from time to time...

The young junior officer Lawrence (Peter O'toole) demonstrates a trick he plays with a match. He lights the match, holds it vertically, and then grasps the matchstick between thumb and forefinger (of the other hand). He slowly works his fingers up the matchstick until his rising fingers meet the descending flame, and he snuffs it out. One of the other junior officers watching tries it out. "Ouch!" he says, "that hurts!"

"Yes" says Lawrence

"What's the trick?" asks the junior officer

Lawrence smiles and replies "not to mind."

Surely there has got to be something of that in all of you. It is one thing to practice tanning or fire starting, or even cooking bugs in your back yards, but the determination to practice such skills together in the wilderness, away from the comforts of your homes is something that has been nagging at me since I encountered this group. I am fascinated by all of the discussion (technical and philosophical), but I am aware that even when I go camping (I'm speaking of modern backpacking, not primitive living or wilderness survival) if things get uncomfortable (usually cold and/or wet) I find myself thinking "why did I come here?"

Interesting, and not judgmental. I'm curious if the real practice of subjecting yourselves to considerably more discomfort (like Andre's 31 days in the wilderness) demands a mental attitude that renders such questions as "why did I come here" inconceivable, and indeed like Lawrence, the trick is "not to mind."

>We often expect that such primitive cultures as the Shoshone must  
>have worked all the time just to stay alive, but in actuality these were  
>generally very leisured peoples.

Mark Twain described the Shoshone as the most miserable people in the world. I don't know what their lives were like, but they lived in a desert. I suspect that wood, bone, and maybe even stone and clay were in short supply.

Would they have chosen to live so possession-free if they had a choice?  
Does anybody know more about them?

Phil,

Many western observers described the Shoshone bands as "wretched".  
They were observed to sit all day in the shade of a tree without doing  
anything to improve their situation--a terrible vice by western standards.

Mark Twain wrote in 1861: "(The Diggers) produce nothing at all,  
and have no villages, and no gatherings together into strictly defined  
tribal communities--a people whose only shelter is a rag cast on a bush to  
keep off a portion of the snow, and yet who inhabit one of the most rocky,  
wintry, repulsive wastes that our country or any other can exhibit. The  
Bushmen and our Goshoots are manifestly descended from the self-same  
gorilla, or kangaroo, or Norway rat, whichever animal-Adam the Darwinians  
trace them to."

The Shoshoneans lacked the technology to exploit their environment  
in a "more respectable" way, otherwise they probably would have, even if it  
meant working more. As it was, they practiced sitting in the shade as a  
means to conserve precious calories of energy. They were the original  
couch potatoes. My aim is not to replicate their experience (I can be a  
couch potato at home any time), but to achieve a level of caloric  
efficiency where I have the freedom to explore nature relatively  
unburdened, without having to work every waking moment to support myself  
(the "Happy Wanderer" thread again).

Always Peace,

Matthew,

You are certainly right about not-minding discomfort. I was surprised to discover while teaching that I was perfectly comfortable even while my students were not. This was not a matter of skills ability. I am simply used to camping on steep slopes, using a rock for a couch, and ignoring small swarms of mosquitoes. Beginning primitives have a surprisingly difficult time adjusting to a campsite where there is not a level place to stand, but those are some of my favorite sites.

Also, I once hated sleeping by a fire and putting wood on it all night, but then I designed a pit shelter with a hot coal bed under it where I could sleep in shorts and a t-shirt without a blanket or any insulation, or even a door. These take 3-4 hours to construct and can be used continuously. Now that I know I can be warm when I want to, I find that I do not mind the discomfort of putting wood on a fire all night; in fact, I kind of enjoy it.

Last, I notice after being out of the primitive loop, that there is a significant impact upon returning to it. It takes a few days of being out there to climatise to the lifestyle.

Always Peace,

Thomas J. Elpel

This is fairly easy to calculate, since just about the only ongoing concern in that situation is food. Once you have spent the initial money on axes, traps, clothing, medicine etc, you only have to buy food staples. You need approximately 50 lbs of food staples per person per month. I have worked as a chef and food administrator for years (long time ago), and have conducted intensive research on food for outdoor expeditions. From what I have learned, this amount of food will carry you through even if you don't have any other food sources. You should buy flour, rice, salt, baking powder and some type of lard. Nature will give you the variety, but at least your survival will be assured.

If you don't want to rough it that much, other food stuffs can be added. If you want, I can send you or post a list of 25 basic staples with which any modern food dish can be concocted if you know how to cook.

With enough food and good health, wandering becomes a delight, because you have strength and energy to improve your situation from day to day. A good medicine cabinet is also important. Again, I could provide a list of what's in my medicine pack for long term walkabouts or expeditions, but you can get that from other sources as well.

It should be fairly easy to buy all you need for walkabout purposes for \$100 per day if you so decide to go that route, once initial investments have been made for basic tools and clothing.

Happy wandering,

AndrÈ

\$100/day?!? It this right, or did you mean \$1.00/day or  
\$100/month? This seems very high, would our hypothetical Happy  
Wanderer have to run in and knock off an occasional bank to make  
ends meet, or does s/he just come from a 'well-established'  
family? ;)

Sean Clemenza  
sean\_clemenza@radian.com

PS - Thank you all for your insight and input.

And might I suggest "Travels with Charley" by John Steinbeck, haven't read it yet, someone just sent me email about it. It's about someone who travels around living in a pickup camper. I am thinking about doing this out of a small trailer. Another book on the subject is Freedom Road, by (I think) John Hough.

In a message dated 97-01-24 16:31:41 EST, you write:

<< It should be fairly easy to buy all you need for walkabout purposes for \$100 per day if you so decide to go that route, once initial investments

have been made for basic tools and clothing.

>>

A current news item thread pertinent to this discussion is the Theodore Kazinski (aka alleged unibomber) story. Kazinski has been quoted as saying (proudly) that it is possible to live on \$150 a year . (I am pretty sure of this figure). He lived about as primitively as one can, once he constructed a shack in which he could live and store half a dozen necessary primitive typrwriters.

Hi everyone,

Sorry for the delay in posting this information on 25 basic food staples for walkabouts which I had promised several days ago. I forgot that I had to translate it first, and also that I had to reformat the Exel file for this media. Anyhow, here it is, finally.

I will be pleased to answer any questions related to this. The data herein presented is based on research conducted over a period of 12 years where I was responsible for planning thousands of expeditions from 10 to 54 days in duration for summer camps in northern Ontario and QuÉbec.

A chef can prepare just about any modern recipe using the 25 ingredients listed below. Hope this makes your less than primitive walkabouts more enjoyable!

Cheers,

AndrÉ

Note: you may have to widen your Netscape window to view the table correctly, and you also have to use a monospaced font such as Monaco or Courier.

*Condiments:*

*Coffee*

*Tea*

*Lemon juice*

*Baking powder*

*Dried yeast*

*Cornstarch*

*Soya sauce*

*Chicken base*

*Beef base*

*Spices:*

*Salt*

*Pepper*

*Cinnamon*

*Curry*

*Chili*

*Dried mustard*

*Assorted herbs*

*Example of how to use this table: 10 day trip with two men, one woman*

*To calculate flour needs, add (180\*2) + (140\*1)= 500 mult X 10 days= 5000 grams or 5kg (or 5\*2.2=11.1 lbs) of flour*

*Notes:*

*The quantities suggested are sufficient for trips where no other food is available. The quantities can be reduced by the amount to be gathered in the wilds. However, the amount of food which it is possible to gather in the wilds is always overestimated. This can cut a trip short, so do not guess at your realistic food gathering capacity.*

*Do not mix fruits together before packaging. Instead, place in tall narrow bags in layers for variety as the trip progresses, starting with smaller items on bottom. Example, layer raisins, dates, apricots, pears, apples. That way you start the trip eating apples, then apples & pears, then pears, then pears & apricots, then apricots, then apricots & dates, then dates, then dates & raisins, to finish the trip eating raisins only. The same formula applies to juice powders, whole-wheat/white flour,*

nuts, herbs, and oatmeal/other grains.

Long and wide egg noodles will do for noodle dishes and will double for spaghetti or lasagna, and when broken into small pieces, for macaroni or soup noodles.

Fresh onions will last for months if left unwrapped in a mesh bag. Chefs will tell you that browned onion is the most important basic flavor in cooking, and dried onion just doesn't work to give that homemade taste.

Fresh eggs will keep for months if left in the shell, even in summer.

Milk powder is very important for nutrition. You don't have to drink it. Add it to breads, bannock, cheese dishes, cakes etc.

Fresh cheese will keep for a long time if wrapped in cloth saturated with baking soda. Waxed cheese and old cheese also last a long time. Moldy cheese is still good if you cut off the mold.

Dried salami and pepperoni last a long time, as do some old fashioned cured hams and bacon. They will last even longer if wrapped in cloth saturated with vinegar. Pemmican and beef jerky are great.

Salted meat is either salt pork which makes great dishes when cut into small pieces and fried with onions as the start to various meals, or salted fish, which are added to rice or noodles.

Canned meat should be in oil, such as tuna fish, for maximum calories per weight.

Fat can be used for deep frying while there is a lot, for making donuts, fish batter, fruit fritters etc., as long as it is strained after each use. When there isn't enough left for deep frying, use for frying or add to cakes, breads, bannocks, oatmeal etc.

The proportions of the different items are the suggestions of the author and will work out if a typical outdoor menu is followed. Midway through the trip and again near the end, an evaluation of proportions consumed vs proportions at-the-start will permit the cook to modify his menu accordingly. To a certain extent, the user may wish to modify item proportions within one category or even within multiple categories by adding and subtracting identical amounts.

The advantages of this system as opposed to pre-packaging meal by meal are twofold:

1. You can pack food for the entire trip in a couple of hours and leave.
2. You have complete cooking liberty: "What do you feel like having tonight?"

Of course, you have to know how to cook when you use this system. But when you do, it feels so much more like living out there rather than bringing city food with you.

Happy wandering!

You are right, John, you would have to include some kind of protein and also other nutrients to live forever on this diet. Otherwise you would get scurvy from lack of vitamin C and other diseases.

You would, however, have no problems with this diet for a period of at least 2 months if you were healthy to start off with, even if you had no supplements whatsoever. Of course, these 4 items would have to be supplemented with plants and meat obtained on the trail for long term survival.

I assumed that those experienced enough to be able to live out there with \$100 a month would be able to trap etc.

Please see my post on 25 basic staples for a complete balanced diet for long term less-than-primitive walkabouts.

Cheers,

Andr 

I was in Zion NY with Bruce Kershner coring trees, and we cored a large (6" diameter) grapevine. Bruce counted 120 rings. I think that's unusual, but my point is that they don't spring up overnight.

Calling the stuff that flows out "water" is a rather liberal use of the term.

This one is easy to do, but I hope no one will do this -- ever! Reason  
being the damage done to the forest ecosystem. Those grapevines are the  
7th layer in a 7-layer forest; providing food for birds in the upper  
canopy. Cutting one at its base for a drink of water is almost like  
cutting a 100 foot tree to make a toothpick. But good to know  
nevertheless.

To me, it depends on how abundant they are. There is no shortage of grapevines where I live in North Carolina. I use them for lots of things. I am careful not to gather things though that I don't see a lot of in an area. And, of course, in a genuine survival situation, I suppose it would not matter. You can die without water in less than a week.

X-Mozilla-Status: 0011

Gene;

Much like the thread on the use of explosives for fishing, the purpose of this list is the spread of knowledge. Obviously there would be no need for this action if there were any other source of water. On the other hand, in a true survival situation, I wouldn't hesitate to use any knowledge I had to survive. There are some basic rules for foraging one of them is never wipe out every last plant in one area. If there is only one plant, leave it. If there is a field of it, don't take all of what you need from just one area. Take a little from several different parts of the field. Last of all take only what you need. I know that I am just restating what others already know, but I don't want this list to fall to political correctness rather than the spread of knowledge, much of it forgotten otherwise. I believe that someone else mentioned husbandry. For that reason your post is valuable.

If you're planning on living off the water from a solar still,  
I suggest you try it at home first. In my experience you need about  
4 stills per person, and you need a shovel and a waterproof container  
to use it.

Phil Goetz

I'd just like to add my comments on solar stills. They are highly over rated. The areas that they work best in are areas where water can be acquired much easier by other methods. Plus they require so many implements to construct. The better use of solar stills is purification of urine for drinking. Normally, you do not drink urine, it will dehydrate you. It can be purified, though, by placing a container of it in the pit beside the collecting container. The suns rays will evaporate it and condenses it in a purer form into the collecting container. This may have to be done a couple of times and of course, only as a last resort. I have not tried this but I know someone who has. I just haven't been in a situation where I was that desperate yet and can't bring myself to experiment with it. You understand.

Other methods of gathering water in moderate climate areas that work better than a solar still: Cut a grapevine high then low about six foot in length. Water will pour into your mouth. You can acquire about 1/2

pint from this length if you cut it off again when it gels over. You cut it high first, otherwise the plants defense mechanism, capillary action, draws it back up before you can drain it.

Succulent plants chewed and spit out. Dew collected on a cloth in the early morning. Ground water dug to a water table close to the surface and strained through a cloth. Of course, there are many other methods and different climates require specthere own special collecting methods.

I am a recovering Mr. Gadget hiker. When I hike I still use my water filter pump. I've heard mention of pills and potions and the like for purifying water. My question:

How  
do you tell if a stream is 'clean'? (Short of seeing dead fish floating by.) When  
you  
need water, do you judge a water source with a set of natural indicators (like types  
of  
plants growing there)? I guess it helps to talk to others who are familiar with the  
area. I just have this fear of Giardia, or such, leaving me blind. (Or worse.  
Dum-dum-de-dum...) I know it is a basic question, and maybe silly, but I just can't  
figure it out.

Love & Health,  
Rees

You can't tell. Also, a recent article in Backpacker indicated that ALL water sources they tested in the wilds had Giardia or other debilitating organisms.

One thing that can be a clue is that water cress (the little green plants in  
water that taste like a mild radish) only grows in pure water. I was taught  
this as a kid. Can anyone tell me if this is true or not. It always seemed  
to work for me. This was in the Ozarks where water cress is plentiful. Or at  
least used to be. Wish I was there again.

If you can find a mountain spring coming out of the earth, and there is not a lot of lush growth around it (which might attract rodents), it MIGHT be safe. Best bet is to consider all sources unsafe. And Giardia is not the only boogyman. I once got Campylobacter (spelling?) from water I had treated but not long enough. I thought I was going to die for about 5 days and after that I was afraid I wouldn't. Christopher Nyerges (<http://home.earthlink.net/~nyerges/>) has a great booklet entitled Testing Your Outdoor Survival Skills. In there is a thorough analyses of all types of water treatment schemes. The best is bet is to fill a one-ounce clear glass, wide mouth jar with about 8 grams of USP-grade resublimed iodine crystals (available at your local pharmacy). Make sure the lid is hard plastic (bakelite). When you need to treat water, fill your one once bottle with some of the water and shake vigorously for about a minute (creating a saturated solution) and then pour this water (not the crystals) into the water supply to be treated. If you keep your iodine bottle at body temperature, 10 milliliters of the saturated iodine solution will treat one liter (1.06 quarts) of water. Whatever you do, don't try to use a plastic bottle to store the crystals. I did that and found that the iodine diffused through the plastic and corroded everything in the drawer I had it in, including a good knife. Ron Hood also demonstrates this procedure in his video #3 on survival kits.

Subject: RE: Clean Water / Giardia

Content-Type: text/plain; charset="us-ascii"

X-Mozilla-Status: 0011

Hi all,

Regarding the query about clean water I have snipped another couple pages from my Field Guide to Primitive Living Skills... which is copyrighted material, but you may print it off for personal use.

...I break my gaze away from the birch tree, and tune in for a moment to the sounds of the water falls. This place always makes me thirsty. It is not so much that I need water, but that I need to drink in the beauty of this place. I reach for the drinking cup on my belt.

The cup is copper, including a copper handle. On the opposite side from the handle is a mountain lion cast in silver with a gold head. I panned the gold in junior high and made the cup in a high-school jewelry class. I loosen my belt, remove the cup, and dip it into the stream to bring up the cold, clear water.

I drink, but then remember an incident from a mile or so upstream from here. I was camping with some friends and they taught me something very interesting about water and people.

On that occasion I dipped my cup into the stream as now, and I savored the cool creek water. My reverie was broken though as one of the guys noticed me drinking the water and hollered, "You actually drink that stuff?!" He was horrified at the thought.

"It is some of the best water I've ever had." I answered, surprised that he was surprised. I have gotten by on some pretty murky stuff in the past; I have literally drank from a cow track in the mud where everything was coated with a heavy white crust of alkaline. No, this mountain water was just plain good.

About a half hour later it was my turn for shock. This same individual opened up his fly and urinated two feet from the edge of the stream and twenty feet upstream from where I had previously been drinking.

Since that time I have noticed that people who do not drink the water are more likely to not respect the water. I have also noticed that people who are fearful of the water are sometimes psychologically less comfortable in the wilderness as a whole. For these reasons, and because the water tastes so good, I generally encourage people to leave their filters and tablets at home and savor the water. But ultimately that is a decision you have to make for yourself.

## Giardia

When I say I encourage people to drink the water I have to admit that I am a little biased. Roughly 30% of people have no symptoms from giardia, and after ten years or so of drinking assorted muck I would say that I am included in that 30%. Someone who has been affected by giardia will likely give you different advice.

The one thing that I can say for certain about the effects of giardia is that those who have had it talk about it years afterward, long after medication has killed the critters. I personally will never forget the immortal words a fellow student on a 26 day trip in 1984. We were all getting together and sharing our individual stories after three days of solo. Several people "got hit" with giardia, and one man told us, "I could shoot farther out the back than I could the front."

Giardia itself is a one-celled protozoan which attaches itself to the lining of the small intestine, and multiplies rapidly in the nutrient rich environment. The organism can pass through the digestive tract as a cyst with a protective, thick wall. It may remain viable in cold water for more than two months, and an infected host is capable of expelling millions of cysts each day .

Symptoms include severe diarrhea, stomach cramps, and sulfurous belching. Symptoms typically occur one to four weeks after ingestion. Antacid and diarrhea medications can both mask the diagnosis and hinder treatment. The commonly prescribed drugs are quinacine hydrochloride and metronidazole. Treatment takes ten days or more. According to a Montana Department of Health and Environmental Sciences pamphlet on giardia, "Fatalities directly attributed to giardiasis are rare." How comforting.

The problem of giardia has dramatically increased in the past thirty years or so. It is uncertain if the giardia is a newcomer to the back country or if people are simply more educated about the disease now than before .

It is also possible that by drinking sterilized city water people's immune systems have weakened so that they are more susceptible now to the effects of giardia, as well as other water borne bacteria.

For example, I think that many people in our community of Pony are quite adapted to drinking unsterilized water. Many of the springs and wells of the community are little more than glorified creek water, routed through a few feet of dirt. In some houses it is not uncommon to find a tiny creatures swimming about in a fresh glass of water. My great aunt once had her water tested, and she was told that it was contaminated with high levels of chloriform bacteria. She was told she should treat the water and she replied, "Well, we've been fine for the last twenty years; I don't see why we need to start treating it now." My neighbors lived without a well for twelve years. They and their two children drank almost nothing but creek water during that time and were fine. From my observations I suspect that susceptibility to water borne bacteria has a lot to do with how strong your immune system is. In any case, giardia is in our streams and lakes to stay, and it is your choice whether or not to treat your water.

If you choose to treat your water there are many ways to do so, including filtering, tablets, or boiling. Filters are typically either bulky, slow, or expensive. Boiling is a hassle and gives the water a burnt flavor. Tablets give the water a nauseous taste and can be harmful if used over an extended time period. Renee and I only used tablets once. We brought some iodine tablets on our walk across Montana. The one time we used them was to flavor the water at Two Dot, Montana because the alkaline

town water tasted worse than the iodine tablets.

The one water purification treatment I do recommend is a product called "Aerobic 07". The product is a concentration of stabilized oxygen in water. It has approximately 1,000 times the normal oxygen content of water. A few drops in your water will kill all anaerobic bacteria, which cannot live in an oxygen environment. The product is made by a company called "Good for you Canada". It should be good for you too, and it is available in many camping supply stores.

I hope this helps answer your questions...

If you would like more info on my books, just e-mail your postal address directly to me (not the group).

Always Peace,

Tom, thanks for your story about giardia. I think I'm lucky enough to be in that 30% who don't get it as well, since I've been drinking with impunity for so long. A couple of questions, though, which you might know the answers to: can the immunity "wear off" as it is known to do with poison oak? And, I once collected a bottle full of clear mountain water, only to wake up the next day with a bottle full of skeeters doing the backstroke. I wonder if giardia cysts de-encyst and become visible to the naked eye, or is it always microscopic??

In a message dated 97-01-21 23:19:31 EST, you write:

> One thing that can be a clue is that water cress (the little green plants in  
> water that taste like a mild radish) only grows in pure water.

I wouldn't trust this. It grows in cold water (often spring fed),but that is not necessarily potable. I have seen it growing thickly in a stream southwest of Minneapolis which flowed through some highly developed suburbs and past industrial plants. I would not even think of drinking that water!

Mike is right! You absolutely cannot tell just by looking. Here in northern QuÈbec, most water is Ok to drink, as long as it's not stagnant. But I sure got sick once last summer.

Basically, if you HAVE to drink water without purifying, big lakes are better than small, fast flowing streams better than slow, and don't drink water where there are human beings living upstream. Usually it is much safer to wait, even if you're a little thirsty, for rainfall, which will usually be safe to drink (if pollution isn't too severe).

To purify, many chemicals will work, usually from your first aid kit. Iodine, peroxide, and other wound cleansers work, about 1-2 drops per quart. Chlorine bleach also works, as does soap of any kind in small quantities. Too much, you get sick from the chemical, too little, from the water.

The very best bet, and by far the safest, is boiling. The rule seems to be 5 minutes + 1 minute per 1000 ft elevation above sea level. However, just bringing to a rolling boil and waiting for several minutes will kill off just about any micro-organisms.

In survival situations, rock boiling in wooden bowls or other methods previously described of boiling are very important. A sardine can in a pocket is a most valuable addition to survival pocket gear because of the clean water obtainable by boiling.

Hope this helps,

Andr 

I think the reason the "primitives" were immune(SP?) to parasites was that the fact that their bodies were used to it or developed a tolerance to it.

I to am tolerant to a certain extent since I drink from rivers wehn I'm

about. But I have contracted some water born sickness a few times. Mostly because I failed to realize a beaver set up came further upstream.

The one thing I've noticed about the human body is how it adapts. A good case in point is poison ivy and oak. You've may of gotten it like crazy as a kid, but as an adult you're body is very tolerant. Or course I may be wrong.

Joe Schilling.

Giardia is everywhere, and even mountain springs that seem to be bubbling up from the living rock are not necessarily safe.

On the other hand, primitive peoples were commonly afflicted with parasites, lice and other delights of the great outdoors. How did they handle it? Should one slip up and contract a waterborne disease, how to survive?

SILVER is one key to keeping water potable. Copper will keep algae from  
forming, as well.

I have a water jug I keep at my shop(you'd think that in the Big City, a  
fellow would have running water,ect...but I did not want to replumb the  
bldg. so I have a plastic ,2liter bottle,filled with water).

I drink directly from bottle, and discovered that after a few days, water  
developed a bad taste,ect.

I dropped a dime in, and have had the water stay good for 2wks, and  
longer. Algae will grow, only where the water is Not.

So, my tip is to keep a silver coin in your canteen, ect.

In the health care industry, a common process for disinfecting equipment is pasteurization (basically a hot water soak). I have a technical bulletin from a company that sells equipment for this purpose. It contains a graph of temperature and time-to-kill for several organisms. You might be able to get a copy by contacting the company

Olympic Medical  
5900 First Ave So  
Seattle, WA 98108  
800-426-0353  
ask for Information Bulletin TDT-FL1A(CO3)

Warning: I do not know if it is still in print or even if the company still exists.

A few data points on the graph:

| Organism                                    | Water Bath Temperature | Time to Kill |
|---|------------------------|--------------|
| Eserichia coli                              | 150F, 65C              | < 5min       |
| Salmonella typhi                            | same                   | same         |
| Brucella species                            | 140F, 60C              | 10 min       |
| Diplococcus pneumoniae                      | 130F, 54C              | 10 min       |

According to Jon Young, Giardia was imported with the Europeans and their cattle. Perhaps Native Americans did not have water problems beyond what pollutants they could see.

The main vector for Giardia, right now in the US is beaver according to the Center for Disease Control in Atlanta, Georgia. Basicly there is no clean water. Can you tell for sure that a beaver didn't poop upstream? Even if it looks like a spring, did it insurge (dissappear/go underground) and then resurge (reappear) where you are?

BTW, If you know of any streams like this I'd really like to know about them. Private email may be best for this. I'm a caver.

Center for Disease Control in Atlanta

Well, the dime would have to be pretty old in order to be made of silver...  
For the last 30 years or so dimes have been made by sandwiching a middle  
layer of copper between two outer layers of copper-nickel alloy.

>

>--John

John,

I have heard that there are different strains of giardia all over the world (Montazuma's revenge, Trotskies, etc.), and people that are adapted to a local variety will react to a foreign strain when they travel. Otherwise I do not know if resistance to giardia will wax and wane with the other ups and downs in a person's immune system. What would antibiotics do to a person's immunity?

As for poison oak, the potency of the plant varies throughout the season, as does a person's reaction to it. Peter Bigfoot (Reevis Mountain School, Roosevelt, Arizona) claims to build an immunity to poison ivy (Rhus radicans--I think we're talking about the same plant here) by EATING the green leaves in the spring before they are too potent. This is corroborated by author Hyatt Verrill in Wonder Plants and Plant Wonders (1939). Extreme caution is advised here, because a reaction to the plant could cause your throat to swell shut...oops?

As already noted in another post, giardia is always microscopic.

Always Peace,

Thomas J. Elpel

Yes, but copper in water has been shown to act as a disinfectant. At the hospital, we used to put "copper wool" in the heated humidifiers of our mechanical ventilators to stop bacterial growth. (Chris, do you remember this?) In the old days humidifiers used to be prime vectors for nosocomial (hospital acquired) pneumonia because patients would cough contaminated secretions into the ventilator tubing and it drain down into the humidifier that was a nice, warm, wet breeding ground. Nowadays, everything is designed differently and there is not so much of a problem. But I do remember reading an article on the bacteriacidal effects of copper back in

the '70s.

I've been out of town for a couple of days so if any of this is a repeat I'm sorry (I tried to read all the posts on clean water)

I got Giardia this summer from eating uncooked cattails from a pond in New York State. I did a fair amount of research and this is what I found:

1.Giardia is not a bacteria (Tom Epel's description is right in his post). This means that what ever you use to kill bacteria WON'T work!!!! I called several manufactures of antibacteria soaps and none of them would kill Giardia, it will only wash it off. One of the companys only sold to hospitals! If one of them says it will ask them to put it in writing(which they will for bacteria) and they change their tone. According to the Pa. Dept of Health, who called me once the doctor reported my case, there are only two ways to deal with Giardia. Boiling water and a good water filter designed to filter out Giardia. Chorine has to be in direct contact with it for over 20 minutes to kill it,

thats why they don't recommend it. Iodine will not kill it.

2. It can live with only cold water for 3 months.

3. It is carried by the fecal matter of any animal (including humans) and some birds that come in contact with the water source, not just beavers.

4. It is highly contagious, 40%-60% of children in day care schools have it! All it takes is one child to get it and the rest is easy to figure out with kids in diapers.

5. All surface water should be considered to have Giardia. The earth acts like a filter so wells generally are not a problem.

6. It only takes one drop of contaminated water to make you sick.

7. It is too small to see with the naked eye.

8. Many people can have Giardia and show NO symptoms. However these people are now carriers and could effect others.

9. It needs water to survive so any surface that has a chance to dry will be safe.

The thing that worked really well for my diarrhea was black walnut hull tincture. It was better than any of the over the counter drugs I took. I had it for a month and a half before I went to the doctor and found out what I had, so I tried many things. I really feel the tincture would cure Giardia. My mistake was I didn't take the tincture enough, the treatment with drugs takes 10 days and after one and a half months I just wanted to get better! One table spoon of the tincture stopped the diarrhea for me for a couple of days.

Hope some of this will help. I'm no doctor so please do your own research, your body may be different than mine.

Walk in Balance,  
Bob Barr

You recommend iodine to treat water. What do you think about this? Could  
the Pa. Dept. of Health be thinking of treatment with tincture of iodine  
from a medicine kit (reportedly not very effective)?

Enjoy..... I have more information

Back-country water treatment to prevent giardiasis.

Jerry E. Ongerth, PhD, PE, Ron L. Johnson, Steven C Macdonald, MPH, Floyd Frost, PhD, and Henry H. Stibbs, PhD

American Journal of Public Health December 1989, Vol 79, No 12, pp 1633-1637.

Copyright 1989 AJPH 0090-0036/89\$1.50 [used without permission]

Abstract

This study was conducted to provide current information on the effectiveness of water treatment chemicals and filters for control of Giardia cysts in areas where treated water is not available. Four filters and seven chemical treatments were evaluated for both clear and turbid water at 10C. Three contact disinfection devices were also tested for cyst inactivation. Filters were tested with 1-liter volumes of water seeded with  $3 \times 10^4$  cysts of *G. lamblia* produced in gerbils inoculated with in vitro cultured trophozoites; the entire volume of filtrate was examined for cyst passage. Chemical treatments were evaluated at concentrations specified by the manufacturer and for contact times that might be expected of hikers (30 minutes) and campers (eight hours, i.e., overnight). Two of the four filter devices tested were 100 percent effective for Giardia cyst removal. Of the other two filters, one was 90 percent effective and the other considerably less effective. Among the seven disinfection treatments, the iodine-based chemicals were all significantly more effective than the chlorine-based chemicals. None of the chemical treatments achieved 99.9 percent cyst inactivation with only 30-minute contact. After an eight-hour contact each of the iodine but none of the chlorine preparations

achieved at least 99.9 percent cyst inactivation. None of the contact disinfection devices provided appreciable cyst inactivation. Heating water to at least 70C for 10 minutes was an acceptable alternative treatment.

---AND---

NASA water purification recommendations.....

Some folks don't like carrying filters, and still don't mind boiling their water. To be entirely safe, water should be boiled at least five minutes. Giardia is killed in less than a minute at 176 F (80 C), well under the boiling point. Bacteria and viruses last longer, but are probably killed in less than five minutes at 190 F (88 C). Some types of virus may last longer; nobody knows for sure. At 10,000 feet water boils at 194 F (90 C); above this altitude boil water about an extra minute for each 1000 feet. Note that it's safe to make pasta using untreated water.

If you have neither the time, nor the fuel, nor the inclination to boil, iodine is equally effective. After 15 minutes (30 minutes for cold water), a sufficient dose of iodine kills all bacteria and viruses. Some protozoa take longer to kill; studies have shown giardia lasting for several hours. Shaking your water bottle may help, but it's always best to wait longer.

One readily-available choice is Potable-Aqua tablets. Dissolve one tablet per liter of water (two tablets for cloudy water) and wait. The problem with iodine tablets is that they degrade upon contact with moisture, so keep that bottle dry, and discard it upon returning home. Another choice is a bottle of PolarPure (elemental iodine). Add the number of capfulls recommended by the thermometer on the bottle. For travel in wet or humid areas, PolarPure is a better choice than Potable-Aqua.

Avoid halazone and Clorox, because chlorine is volatile, slow to disinfect, and works differently against protozoa and viruses at various pH levels. It also reacts with organic compounds to form carcinogenic chloramines. Iodine is not highly toxic, and in fact is an essential ingredient of human nutrition. However, continuous ingestion of large doses may cause health problems, particularly for people with thyroid problems.

The accepted concentration for iodine disinfection is 8 milligrams per liter, but this is mostly to get rid of protozoan parasites. A good way to reduce overall iodine consumption and minimize that iodine flavor is to filter first, then use a low concentration of iodine to get rid of bacteria and viruses. For this, a concentration of .5 mg/L is deemed adequate, so one capful of PolarPure or one Potable-Aqua tablet should disinfect around 16 liters of lightly filtered water. Various inexpensive ceramic filters with 1 micron pores are fine for removing protozoa.

----AND----

The water quality association says;

A common waterborne protozoan that forms cysts and is resistant to disinfectants such as chlorine and ultraviolet light. Giardia can be removed by filters that capture all particles of four microns and greater in size.

Does that help? I have more if you'd like. Iodine crystals, in a 1 oz bottle, as shown in my video number 3 and mentioned previously, remain effective portable treatments. Boiling and filtration is best.

Seeya!

Great Post!!!!!!

> I got Giardia this summer from eating uncooked cattails from a pond in  
>New York State. I did a fair amount of research and this is what I  
>found:

-----snip-----

> 3. It is carried by the fecal matter of any animal (including humans)  
>and some birds that come in contact with the water source, not just  
>beavers.

I think I'm the one that posted the info about beaver. My info says only that the beaver is the main vector. I may have not been clear enough about this. You're info is definitely correct. It can exist in any fecal matter.

I don't know that I could even say some birds. I don't know why any bird would be affected differently than another I could use any info on this that anyone else has

.I've also not been able to get a definite yes or no about fish. It may be right there, but I've not seen it. Sure seems that they;d be a likely candidate with the temp range that Giardia can survive in.

I don't know what it needs for nourishment.

Merv

p.s. I think we need to check one of Ron's brown streamers too.

Ron,

Your post on water purification procedures was helpful because it was based on some experimental data. My question is, how do you arrive at the dose of saturated iodine solution to purify a given quantity of water. Are there data relating quantity, time, volume, and temperature or are your (and Nyerges') recommendations guestimates?

Rob Chatburn

I think the PA dept. should go check their MERK manual and the STANDARD DESK REFERENCE - That is the resource for the iodine treatment my friends developed. Works good here

for a LOT of folks in Colo.

I can't speak for Chris. He may have other information than that from which I worked. First, experiential data for what it's worth. To date I've led @ 6,000 persons into the mountains on multi day excursions. To date we have had 4 cases of symptomatic Giardiasis with lab verification. Most of these cases were mild. None of these people used iodine. I emphasize the use of purification/filtration. Crystalline Iodine is the preferred method for water purification because of its dependability, cost, portability and ease of use.

We used iodine crystal purifiers provided by the military during my time in the middle east, Vietnam, and Central America. I used the system exclusively in my own travels to most of South America, Asia, India, Pakistan and Northern Africa. I've been ill on a few occasions but I attribute this to the accidental ingestion of polluted water (swimming, bathing, ice, falling into a gutter while in a drunken stupor etc.). I have enjoyed parasitic infestations which cannot be killed by anything less than a blowtorch or a shotgun. I love travel. Giardia is so innocuous..... Try picking worms from a watery high speed brown steamer splattered on the floor and seat of a taxi in Bangladesh. Even I won't eat THOSE worms.....

Now for a tiny bit of "Science".

Memo from the Centers for Disease Control:

GIARDIASIS

GIARDIASIS: By Dennis D. Juranek, Chief, Epidemiology Activity  
Parasitic Diseases Branch  
Division of Parasitic Diseases  
Centers for Disease Control

>Disinfection of water with chlorine or iodine is considered less reliable than boiling for killing >Giardia. However, it is recognized that boiling drinking water is not practical under many >circumstances. Therefore, when one cannot boil drinking water, chemical disinfectants such as >iodine or chlorine should be used. This will provide some protection against Giardia and will >destroy most bacteria and viruses that cause illness. Iodine or chlorine concentrations of 8 mg/liter >(8ppm) with a minimum contact time of 30 minutes are recommended. If the water is cold (less >than 10 deg C or 50 deg F) we suggest a minimum contact time of 60 minutes. If you have a >choice of disinfectants, use iodine. Iodine's disinfectant activity is less likely to be reduced by >unfavorable water conditions, such as

PhD, and Henry H. Stibbs, PhD

American Journal of Public Health December 1989, Vol 79, No 12, pp 1633-1637.

Rob, you also wrote:

Ron,

Your experience and the CDC recommendations for use of iodine are good enough for me. Still I am trying to understand the subtle differences. For example, for clear water the recommendation is 0.25 mL of 2% tincture per liter of water. A tincture uses alcohol as solvent as opposed to water in the system you describe. You would think that a saturated solution with alcohol might hold a different concentration of iodine than water. This is probably splitting hairs but...

>I think they work. But then, I'm just guessing. Ask  
>Chris.....(Nyerges)

I did. He told me to use 10 mL of saturated aqueous solution per liter. That's 40 times the CDC recommendation for a 2% tincture. No doubt there is a very wide range between the minimum effective concentration and the LD50—that is the dose that is lethal to 50% of test subjects ;-)

I really do not have a problem with all this. You would not believe the amount of pharmacological guesstimation that goes on in hospitals. Maybe it's not worth discussing further.

Thanks for the info.

Rob Chatburn

The formation of channels under these conditions is something I know a bit about (not that I'm an expert), since the same effects are a problem with liquid chromatography. The way to avoid them is to

1. pack the material carefully to avoid cracks, etc. The ideal is to make a slurry and then pouring it into the "column". I have never tried this in real life, but it *might* work with crushed charcoal. The problem is to create a suitable outlet-filter to void all of your charcoal to flow out of the container (spagnum?).
2. avoid at all costs to pour the water directly on the charcoal bed. Use a prefilter (a wad of spagnum, for example).
3. One you have used the filter and allowed it to dry, cracks might have formed in the charcoal.

This is a theoretical discussion, and I do not know which of these are important in creating an effective water filter. When I make them I have always used a top wad of sphagnum, as well as one in the bottom. First time I think of the effects of drying out, thought. Might or might not make a difference.

> Activated charcoal is created under heat and pressure. Does anyone know if  
> one can create an activated charcoal block by placing mud or clay over

> providing a slow-drip charcoal filter in the bush.

There is one, it was developed by, if I am correctly informed, Stefan Kallman while he was working for the Swedish defense research org. (FOA). It is made in, e.g., an old beer- or softdrink can, with the top removed, and the bottom perforated. I suppose natural containers could be used instead, even though left behind beer-cans are far too easily available in many wilderness areas :-).

\* Start with a layer of sphagnum moss in the bottom. About an inch or so should be enough

\* Add a mixture of partially humified peat (the lower, pale brown, reaches of sphagnum bogs) and crushed charcoal. About half the volume of this.

- \* Add a top layer of sphagnum. At least another inch.
- \* A layer of small pebbles (say 1/2" diameter) on top.
- \* Rinse the filter with a few volumes of water before "use". Don't overdo it, the capacity is supposedly something on the order of 20-30 times the filters volume.

The idea is that the sphagnum's effects (bacteriostatic, chelates metals, etc), the well known effects of charcoal, and the fact that peat is (partly) activated charcoal is all combined. It has, so I'm told, been proven good enough to turn sewage into potable water, but I haven't seen the lab data on this myself.

Many better water filters use a solid activated charcoal filter. Apparently, crushed activated charcoal allows for water to form channels and pass without being filtered. I have heard that aromatic ring compounds can be introduced to the water if using plain charcoal.

Activated charcoal is created under heat and pressure. Does anyone know if one can create an activated charcoal block by placing mud or clay over charcoal and baking it in a campfire? Seems that might be a solution to providing a slow-drip charcoal filter in the bush.

Hi Rob,

Just to clear up a few technical points.....

> You would think that a saturated solution with  
> alcohol might hold a different concentration of iodine than water. This is  
> probably splitting hairs but...

Absolutely! (not splitting hairs..... I mean water and alcohol DO have different levels) FYI the following excerpt.....

"Iodine occurs as bluish black plates that are soluble in alcohol but only slightly soluble in water (0.03%). Tincture of iodine contains 2% iodine and 2% sodium iodide in alcohol. Strong iodine solution contains 5% iodine and 10% potassium iodide in water. Iodine is precipitated by starch."

"The fatal dose of iodine and iodoform is estimated to be 2 Gm. (30gr). Fatalities have not been reported from iodochlorhydroxyquin or iodide poisoning."

(Handbook of Poisoning: diagnosis and treatment; Robert Dreisbach, MD, PhD (LOCC nr76-78901))

> No doubt there is a  
>very wide range between the minimum effective concentration and the  
>LD50-that is the dose that is lethal to 50% of test subjects ;-)

The author didn't seem to equivocate on the lethality... no LD50 for this guy.!

>I really do not have a problem with all this. You would not believe the  
>amount of pharmacological guesstimation that goes on in hospitals.

Absolutely nothing personal Rob..... I do believe it ..... that sort of "guesstimation" killed my mother.

I guess we've hammered the iodine topic pretty well. Wadda ya think?  
Thanks for the great book list! I bet that will find it's way into several bibliographies.....

I just rec. a cat. showing the SWEETWATER brand of water filter. Designed  
for backpacking. it filters and has a removable iodine cart.(to handle up  
to 90 gal).

Claims to eliminate: gairdia, crypto, bacteria, herbicides, pesticides.  
Iodine eliminates threat of virus.

Well guys who are active camper/packers know about this stuff, anyway.  
But with all the talk about how much iodine to use....maybe a special  
cart. is what is the safest way to "iodinize" water.

Just my 2 cents.

Hello All,

A few comments on this thread:

The use of a hole extending into the water table to source potable water probably has some merit providing certain assumptions are considered;

1. The labor intensity, the filtration rate, the lack of portability make

this method more suitable for static circumstances in which the user is going

to be in one area for a day or so.

2. IN GENERAL dirt is dirtier than water but makes a better filter than water. The filtering aspect of soil comes at a cost of seeding the filtrate

with more stuff to filter. Odds will favor that unwanted stuff will exceed

filtration ability of the soil unless additional filtration is provided.

3. The micron level and biocidal activity needed for 100% microbe elimination

is probably not practical with field expediant methods (short of boiling).

The best you can do is try for maximal minimalization and weigh that roll of

the dice against the level of certainty that you will die of thirst in less

than 5days

Par's information on a peat-charcoal-sphagnum filter is well founded. I would

propose a twist on the "old beer can component. Is not a hole in the ground

an "old beer can" stripped of it's layers of tecnology? Why not line the hole

with the peat-charcoal-sphagnum filter. Consider the surrounding soil a pre-filter. Or perhaps line the hole with water impermeable clay and connect

it to the stream with a peat-charcoal-sphagnum filled channel and cut the

soil filter out of the loop.

How many of you have drank from a free flowing stream and not suffered?

I imagine a lot of you have been less than totally cautious and that the actual

incidence of illness is relatively low. Without a doubt, even a mild diarrhea

may be catastrophic in a true survival scenario. However, on the continuum

between naked survival and warm cozy technology, the affordabilty of mistakes

has an inverse relationship with the number of options we have in preventing

them.

I propose that it may be more important that we arm ourselves with knowledge and concepts than specific skills. It will be the synthesis of solutions from available resources in the face of recognized risk that is the key to survival. Understanding that water seeks its own level, that giardia is a micron sized killer, that if I don't drink for 3-5days I will die, that if I shit more than I drink for 7-10 days I will die, that if I look around me I can use what I know about water and giardia to cut my risk by half, and doing so will expand my window by a factor of four, that at any time my number can come up on the dice and lightning will kill me in my debris hut. The peat-charcoal-sphagnum filter in a great idea.....IF you can find peat and sphagnum and charcoal.

On Mon, 11 Nov 1996, Kenneth H Keller wrote:

> Thx. for your water filter info. In what sense is this filter effective?

Lots of features:

1. The sphagnum moss have been found to chelate heavy metals (among other stuff; the Swedish army discovered that it can be used for cleaning up after NBC-attacks...).
2. The sphagnum moss is bacteriostatic (perhaps not at a clinical level, but it does still do something good towards the goal). Also remember; sphagnum is good for would dressings for this very reason.
3. The charcoal will, as others have pointed out, do a fairly god job against many pathogens, in addition to reducing some chemical pollutants.
4. The peat is also good in this respect, since it is partially "active charcoal", as used in many commercial water filters.

For those worrying about black "nasty" water: (1) it is not dangerous even if so, and (2) most of the loose charcoal will be removed when you "prime" the filter with a few volumes of water.

The Swedish army who discovered this filter has apparently tested it on raw sewage with drinkable water as the result. I haven't been brave enough to try it on anything like that, but I have drunk some fairly questionable water after using the filter.

Remember; the filter does have a limited lifespan, IIRC something on the order of 20-30 volumes.

Another I would add to the peat/charcoal/moss water filter (whether in a hole in the ground/beer can/bark/hollow log is sand. When I was designing the greywater system for my off the grid dome home that I was building last year (and still finishing :-), a septic design engineer told me that 1 foot of clean sand will filter out raw sewer to pure water. I have been tinkering around with a hollow log, with a lattice of sticks and a grass mat in the bottom, topped with 1 foot of sand. On top of this log, is another hollow log that is a little wider (like a funnel) where you pour the water in. The 2nd log holds the water until it filters down thru the sand, and drips out into your burned out bwol/bark basket, etc. I think adding a layers of sand throughout the peat/charcoal/moss will make it even more efficient, and longer lasting, especially if the top layer is sand. You could hand scoop out this layer and replace it a needed, and most "goobers" from the unpure water will ctach in this layer.

I talked with Tom about using sand as a filter (from his field guide to survival, where he mentions it very briefly without details on turning brackish swamp water into something resembling water) at the Back to Back last month, and he said he made it about 4 feet long, and still "boiled the hell out of it" afterward.

Sorry that I don't have any "scientific" data to back it up, but plan on playing with it more with combos of all materials. In a pinch I'd use

it, probably with in hole as the safest method.

Bruce

Subject: One more word on human scat, water, and filters

Message-Id: <199611160314.WAA30738@mailnfs0.tiac.net>

Content-Type: text/plain; charset="us-ascii"

Just wanted to second the motion not to defecate near water, and offer an opinion about filters. Humans are now very common carriers (even without symptoms) of giardia to other humans (and maybe to animals). For that reason, overnight camping is limited or prohibited around untreated water supplies like the Quabbin reservoir in Massachusetts, to minimize feces. Giardia is apparently not destroyed by being consumed by fish or other macroorganisms, just passed along or further incubated.

Currently wildlife like beaver are taking the rap ("beaver fever" being a very catchy term) and are being killed for fear of their introducing giardia, despite the fact that infections today are suspected of quite often being the result of human contamination.

Giardia is apparently a very hardy microorganism that even chlorination at typical water-treatment levels doesn't kill easily. It's also a very small

organism (1-5 microns) that typical soil filtration won't catch unless you use a few acres of it. (Sand pores being around 50-200 microns, pure silt and clay somewhere around 1-50, if I recall correctly. Nearly any natural mineral soil will be a mixture of these.) A filter using pure, uniform clay or silt might be effective, but the rate of water flow would be pretty puny, I think. (Which is why commercial micropore filters have pumps.) Survival filters, because they have lots of different materials in them, would have pores way in excess of the necessary size. I don't have any info on charcoal. Organic stuff like moss is much more porous.

Obviously, in a survival situation, you have to make some tough choices, but

I think I would go first for collecting dew (not-pooped-on), as Tom suggests, or collecting from plant sources like grape vines. (Tom probably has some pretty strong feelings about giardia these days, as apparently that what was laid him *\*very\** low for a year or so!)

- Dave

Hi everyone,

When we send messages to the group, there should now be a Reply-to line so replys can automatically be sent back to the group. If this is not working, please let me know.

Thanks to Matthew Rappaport for pointing this out.

Hi again all,

I would like to make a file which I could send to new subscribers which=20 would be a compilation of all the introductions which are received from=20 members when they subscribe. I think this would be a nice way of saying=20 welcome and would make new members feel more at home.

I don't know if this would work, what do you think?

If this is a good idea, then maybe all of you could send me a short=20 introduction about yourself to include in this file. The list could=20 start off with the introduction of a few "group leaders". Ben Pressley=20 has already indicated he would like to be one of the group leaders. How=20 about others? Everyone who receives this message is invited to be group=20 leader. The group leaders role would be to maintain the proper=20 orientation of the group.

What do you think of this idea? Am I exaggerating again?

Thanks for your input,

Andr=E9

-----  
NEW Primitive Skills Group! ANNOUNCEMENT!

The main purpose of this group is to provide a way by which all lovers of primitive skills can discuss various subjects related to wilderness ways.

We have chosen to call it the Primitive Skills Group because whether we are discussing primitive, wilderness or survival skills using some modern devices, we still draw our inspiration and basic knowledge from primitive people who have survived for thousands of years using only what nature provided. Primitive literally means 'first' or 'earliest', therefore primitive and survival skills are our common heritage. The purpose of the group is to share knowledge about this common heritage which can inspire us and comfort us today.

Topics which you are encouraged to discuss with other group members are:

1. All primitive wilderness living skills such as shelter, fire, cordage, primitive tanning, natural foods, primitive living, primitive rafts & boats, primitive direction finding, primitive trapping techniques, weapons for wilderness survival, primitive hygiene, protection from insects, primitive weather prediction, fighting cold, primitive medicine, traditional dog sledding, edible plants, primitive clothing etc.
2. Subjects related to modern realistic wilderness survival, such as surviving unexpected emergencies after airplane crashes, broken down snowmobiles etc.
3. Discussions about very specific environmental concerns related to the practice of individual primitive skills are also welcome.

Remember! This group is intended for fun, sharing and learning about primitive wilderness survival and living skills. All members will be asked to refrain from discussing topics related to specific religious, political or ethnic views.

Your participation in the discussions of the Primitive Skills Group would be appreciated by all other members!

To join the group send an E-mail with the following text in the main body of the message:

SUBSCRIBE PRIMITIVE-SKILLS-GROUP

Put nothing else in the message, not even a signature. Send the E-mail to:

listserv@uqac.quebec.ca

After a short while you will receive a message saying that you have been successfully subscribed. Once you have subscribed, you can send a message or a question to the entire group by sending an E-mail to:

Primitive-Skills-Group@uqac.quebec.ca

You will also receive messages or questions which any of the other members send to the group.

To unsubscribe, you must send an E-mail to listserv@uqac.quebec.ca with the words

SIGNOFF PRIMITIVE-SKILLS-GROUP

in the body of the message (nothing else).

Looking forward to sharing primitive skills with you!

Best regards,

Dr Andr=E9-Fran=E7ois Bourbeau  
Professor of outdoor pursuits  
University of Qu=E9bec  
List manager

Hi Merv!

Chris here. I've had some experiences with dowsing. Seen our dowsing thread on Thrower (?), at:

<http://www.crl.com/~mjr/findit.html>

Could be flame bait & taboo subject: challenges the belief systems of some and perhaps not enough in others. Maybe it's been that way since Descartes and the dawn of the "Age of Reason" or some such - I dunno. I use it and sometimes it seems to work. No flames (please) list members. Sure it can be explained OR explained away, but a little voice in the back of my mind keeps saying, "There are more things under heaven and on earth than is in your philosophy, Horacio". Dowsing's fascinating at least in a historical/contemporary context as a primitive practice that's survived to the present time.

Any dowsing experiences, Merv? Maybe a possible use for that Christmas tree after the big day, eh?

Chris

Hi folks,

Dowsing was definitely not what I had in mind by primitive direction=20 finding, but I don't mind the subject for now. In fact, many survival=20 books claim that such things can work. I've seen finding water by=20 pendulum, witchhazel sticks, burying rocks, following spider web=20 orientation, and all sorts of other weird unexplainable stuff.

Now, as a former semi-professional magician, I maintain that these=20 things are all hocus pocus. My friend the Amazing Randi (Randall=20 Swinge), who is Houdini's successor in magic circles, has offered=20 \$100,000 to anyone who could demonstrate something weird in seance=20 sessions that he couldn't explain (put the trick to light). He has=20 never had to pay up in the last 10 years since he offered the prize.=20

I will offer the same \$100,000 to anyone who can find a jar of water=20 buried in a field at random after multiple tries using any of the so=20 called water finding methods. The common answer I get is that the jar=20 interferes. Ok, let's put the water in earthenware crocks. Surely that=20 is easier to find than water deep down through granite etc. It is=20 obvious to my scientific mind that these techniques were invented by=20 someone to take advantage of unsuspecting people and earn a living=20 without working. It is absolutely incredible, don't forget, the length=20 to which a magician can go to obtain information which will credit him=20 with "superhuman" capabilities. Some people are absolute geniuses with=20 hidden technology which will blow your mind with it's impossibility. =20 Others are absolute psychological geniuses.

I think the explanation to dowsing on the browser page is accurate:

"As it turns out, the dowser may do nothing more than stimulate the users' own subconscious knowledge of where he or she lost the knife.=20 Of course since we are usually looking for knives or other implements=20 that we have lost, this may be sufficient, especially if it works more or less consistently."

In fact, the same amount of time spent actually searching for the knife=20 in a methodical manner would have found the knife at least as quickly.

Searching for lost objects in survival situations can become very=20 important if not life threatening. I remember visiting one student in a=20 survival simulation groping around in the dark to find his whistle to=20 call it quits. "I lost my matches in the snow" says he. I patiently=20 talked to him, found out where he had been, and told him to start=20 searching methodically in the most likely spot. After a few minutes, he=20 found his matches and did not "die".

I teach that the trick in searching for lost objects is never to search=20 in the same place twice. Do it right the first time. Go very=20 methodically and precisely so you can eliminate sections of ground=20 definitely. You will eventually find it this way, it's only a matter of=20 time. I you don't look methodically, you can search forever.

Sorry about the flame, couldn't help myself, you hit a sensitive nerve.

It doesn't matter how many times people tell stories of "it worked",=20 until someone can demonstrate that "it works" in a repetitive way, it is=20

just blind luck.

Bury a knife somewhere at random in a sawdust pile 100 feet square, and you will never be able to find it repeatedly using dowsing, I guarantee that!

Just a stubborn scientist replying!

Howdy,

I'm a soldier in the US Army, stationed with a National Guard unit in Virginia. We do a lot of direction finding, land navigation, and I would be very interested in discussing this.

I suppose that one of the first ways of navigating was to follow a stream bank, up and down stream, to get somewhere. Still recommended for those lost and unhurt to simply follow a stream down and continue until you meet up with someone which is inevitable. We also look to the sun for direction.

I must ask though, are we talking about methods used by primitive peoples or methods using low tech skills? Won't always be the same. Interested in hearing from other members of the group.

--

Sincerely,

Barent

Dowsing as direction finding? Means something different to me. A nice  
 forked willow wand or a couple of coat hangers. I think that it works  
 for some, not all, because of the electrical charge we all carry.

"Primitive" direction finding wasn't all that primitive. If you look  
 into archeoastronomy, you'll find that pre-Conquest peoples in both  
 North, South, and Central America had extremely accurate observatories  
 all over the place. They clocked the movement of stars, planets, sun and  
 moon, had buildings and whole communities arranged on lines to  
 correspond with various orbits, holes in buildings where the sun shone  
 thru only on the equinox, etc. The precision of their work often  
 astounds modern day astronomers.

Since they had no magnetic compass, they didn't orient so much  
 north/south/east/west as toward where the sun appeared at equinox and  
 solstice.

Which reminds me -- today is the Winter Solstice.

=03=03Following some streams here in Qu=E9bec would sometimes lead you to=  
a 1000 mile trek without seing=20  
anythin until the artic ocean! Also, many places here are height of land=  
where one creek flows=20  
into the atlantic and another to Hudson's Bay and another to the Artic. =  
So I'm not so sure about=20  
the follow the creek method. Also, following creeks here usually means y=  
ou have to walk in alder=20  
(Alnus spp) swamps which makes going very rough, especially on creeks tha=  
t wind and wind and wind=20  
around bend after bend.

The sun and stars are indeed the safest orienteering methods.  
>=20

Both subjects are interesting. However, I think you're opening up a very=  
big can of worms, (we=20  
could write a whole book on the subject). Maybe more specific questions =  
will help the rest of us=20  
answer.

How about the question of moss growing on the north side of trees, for in=  
stance. What do people=20

think of that?

Best regards,

Andr=E9-Fran=E7ois

Greetings fellow primitives!

I think it would be nice, now that we have a few dozen members, for some=20 of us to introduce ourselves. If you agree, you can send an intro about=20 yourself to the group.

Might as well start by myself.

Hi everyone, my name is Andr=E9-Fran=E7ois Bourbeau and I'm a professor a= t=20 the University of Qu=E9bec, Chicoutimi campus, where I teach outdoor=20 pursuits in an adventure tourism bachelor's degree. This 3 year program=20 is in french, so unfortunately much of the material I have developped=20 will have to be translated before it is useful to many of you- sorry=20 about that. I have been at the university for 15 years now, teaching=20 courses such as winter camping, whitewater canoeing, wilderness=20 survival, outdoor leadership, environmental awareness, philosophy of=20 outdoor education and such. I also have research duties, and my field=20 of interest is "coureur de bois" and wilderness survival. I did my=20 doctoral thesis on how to write clear instructions for primitive=20 wilderness survival techniques. Since then, my research methods have=20 been largely experiential: basically, I put myself in simulated=20 situations in order to learn about old ways and develop new knowledge. =20

I conducted two major trips, one was a 31 day experiment in 1984 where I=20 was dropped by helicopter on the 50th parallel without food, without=20 fire, without tools, without shelter- just the light clothes on my back. = =20

That was a pretty rough trip, details of which are to be found in a book=20 I wrote about the experience entitled "Survie au Gr=E9 de la Nature"-= =20 sorry, only available in french for now. The book is a day by day=20

report on the trip, to which was added a scientific report on various=20 subjects studied during the experiment.

The other major trip I did was in 1988, a 40 day reconstruction of a=20 trip along the fur trade route in the year 1838. All the materials used=20 were authentic reproductions of the period's gear, including real=20 birchbark canoes and even handsewn underwear. This trip is documented=20 in a film by KEG productions of Toronto called "Man of the Wilderness"=20 which has been translated into many languages and has been shown on many=20 television networks around the world.

My main interests are in developping wilderness survival techniques for=20 someone lost or downed in the boreal type forest. All ideas I find from=20 other parts of the world I try to adapt to materials found here. For=20 example, fire saws are possible with bamboo- I try to find materials to=20 make it work here (haven't found any yet).

I am really looking forward to all the fine discussions I am certain=20 will develop as the Primitive Skills Group grows. By the way, I am the=20 list manager for the group, so any concerns you may have about the way=20 the group functions can be addressed directly to me.

Finally, please note that I love hamburgers and french fries, but no=20 ketchup.

Thank you,

Andr=E9-Fran=E7ois Bourbeau

PS I've attached some interesting links.

# [SURVIVAL...](#) **A Beginning**

Many of the sites referenced below are busy and may not always respond. If you can not get through once, please try again.

## [DISCLAIMER](#)

Do not venture into the wilderness without your  
[staff!](#)

Check in here for  
[water purification!](#)

One possibility for emergency  
[electric power](#), and a  
[do it yourself](#)  
version.

Survival situations sometimes require some awareness of  
[time!](#)

Critical WEATHER data from the  
[NOAA](#),  
the [BBC](#), and  
[CNN!](#)

Some interesting information on the subject of  
[MREs](#)

We even have a line on survival  
[feminine hygiene!](#)

- [Radio](#) - Radio is the

survivors medium! It requires less infrastructure than any other technology able to span the globe at the speed of light with [news](#) and other information!

[Percon](#) brings us a searchable frequency database. If you're in Northern California, check out the [CAVE](#).

[Curt's Cyber Corner](#), has lots of links to clubs and resources throughout the U.S., and here's a cute compilation of [stupid scanner tricks](#).

Here is an extensive list of radio [sources](#) on

the Internet from the folks at [Javiation](#) in England, and others from

[The American Radio Relay League](#),

[Paul Jones](#),

[Pete Costello](#), and

[SCAN-L](#) from

[Peter Laws](#).

[Survivalist](#) radio is also available.

While you're listening, you might tune in to some unfamiliar

[lingo](#).

- [Knives](#) - A tool far more versatile in the end than any firearm! Here you will also find

your entry way to the world of [throwing weapons](#), [crossbows](#), and other [primitive weapons!](#)

- [MAPS](#) - I just know you appreciate and understand the value of good maps! Yes, the [USGS](#) is also a marvelous source of these invaluable aids, and there is this interesting demonstration of large scale [digitized mapping](#) technology, and I have found nothing to beat this smaller scale [landform imaging](#) of each U.S. State, unless it is these interactive map locators from [mapquest](#), and [mapblast!](#)
- [SAR](#), a marvelous Search and Rescue page from B.C. Canada, and a collection of [FEMA SAR](#) sites. For SAR equipment, check these [catalogs](#).

- Don't ignore the wealth of information American tax dollars provide through [FEMA](#), the Federal Emergency Management Association. If the primary site is busy, here is an

[alternative](#) that carries much of the same information. Finally, here is FEMA's international [directory](#) of disaster management services.

- [Manuals](#),  
[\[alternate\]](#),  
[kits](#),  
and catalogs from  
[Survival Index](#),  
[Brigade Quartermasters](#),  
[Jungle Outfitters](#),  
[Campmor](#), the  
[Underground Emporium](#),  
[Survivor's Surplus](#),  
[Ultimate Weapons Systems](#),  
[T.C. Media Martial Arts](#),  
[Turtle Press Martial Arts Books](#),  
[Wilderness Unlimited](#)  
(including a particularly good set of [first aid](#) references).

Don't forget this interesting mix of products and services at

[A&B Enterprises](#),

an extensive on-line weapons catalog from

[KLOS](#),

and an excellent natural survival page and magazine from

[Wilderness Way](#).

- Pointers to [survivalism](#) in the tradition of those [prepared](#) to defend themselves against all [adversaries](#) at all costs! This section includes [Kurt Saxon's](#) survival page, [Dave Paxton's](#) survival page, the [Subrosa page](#), the [Paul Revere Network](#), and Dave Fuestel's page on [FedGov](#) activities that may interest you.
- Long term storage and **food** supplies from: [Walton Feeds](#), [Live Oak Farms](#), [Storable Foods](#), [Survival Center](#), [Product Source International](#), [Mountain View Foods](#),

[Secure Future](#),  
[Happy Hovel Foods](#), and  
[Patriot's Canteen](#).

Also this excellent entry point to  
[permaculture](#) for sustained  
food, shelter, and energy production. There is  
also this link to  
Christopher Nyerges'

[School of Self-Reliance](#)

with lots of pointers to information about edible  
plants and much more.

- You can see what the  
[U.S. Dept. of Defense](#)  
wants to tell you (remember who gave away the atom  
bomb? Hint, it wasn't  
the  
[spies](#) they blamed it on). Definatly look  
here for some pointers to other interesting  
[military](#)  
points of departure, and this page where you can  
help monitor  
the military activities of the  
[U.N.](#)
- Proper training is important! If you can't use  
what you've got,  
what good is it? Here are training camps from the

Welcome to Ted Bailey's Home Page on *Primitive Technology*. My main interest is boomerangs and throwsticks. In the process of acquiring old throwsticks for my collection, I occasionally find other items that stimulate my interest in primitive weaponry. From this page, I hope to pass on information about some of these technologies and add links to other web pages that have a similar focus. You should link to this page and follow the instructions below:

---

## Get an email subscription to THROWER

**thrower** is an email subscription service that brings people together who have an interest in anything that is thrown. This includes: boomerangs, atlatls, bolas, knives, chackra & slings. There is a heavy emphasis on knives, but start a thread on another topic and see what happens. If you have an interest in Primitive Technology, you need to subscribe to this email subscription service.

To subscribe, put **SUBSCRIBE THROWER** and nothing else in your message body and send to: [thrower-request@dfw.net](mailto:thrower-request@dfw.net) After subscribing, you can send messages to: [THROWER@dfw.net](mailto:THROWER@dfw.net) Many thanks to [Matthew Rapaport](#) for setting up the **thrower** group.

---

## Get an email subscription to KNAPPER

**Knapper** is an email subscription service that brings people together who have an interest in flintknapping. To subscribe, send email to [knapper-request@iastate.edu](mailto:knapper-request@iastate.edu) with the words:

subscribe knapper [your email address here]

in the body, not the subject. (You don't need to put the brackets in there either... ;)

---

Thank you to Andre for inviting me to participate. I am a classical arm-chair primitive! I enjoy a good camping adventure, and have had a fair number in my youth, but none for a decade or more now. Even these were not primitive living the likes of which our host has experienced, but rather late 20th century American style back-packing which means NOT that you use what is around you to make your way, but that you touch as little as possible! The object as much as possible is to leave the environment as untouched as possible while you pass through it. I am not a hunter, though I have fished (mostly in salt water). I know how to prepare fish and other sea food, but would like to learn to dress game, even if I don't kill it. I do enjoy shooting with fire arms, and bows however, and could hunt if I had to do it, even with a slingshot. Better I round myself out gaining some experience with traps! My real interest in bushcraft skills for now is not in wilderness living, but in living more or less comfortably though a period of normal infrastructure and service disruption in my semi-urban environment, typically as a result of some natural disaster like an earthquake! Here what is important is having stocked the right materials in the right quantities in places that survive the initial disaster. If the supermarkets are closed long enough, I may want to fall back on some food finding skills for a while... I look forward to future conversations. matthew

 -----Fruit flies like a banana--- >> ----- >For thrower, send a

HELP command to: I heard the same story. The darts are fired from a crossbow, and they=20 aim at the belly of the monkey. The monkey feels the impact of the crossbow arrow and sees the strip of cloth hanging from the arrow and tries to=20 stuff what he assumes is his intestines back into his abd. This is supposed to allow the poison time to work. Any ex Special Forces guys out there that can confirm if this is what the Montanyard peoples did, and what kind of poison they use. This type of crossbow arrow is about the same diameter and size as the Cherokee darts only they use bamboo vanes as fletching. WE really need to move this to the new list though. # Knife Throwing, and Throwing Knives

## 1997 AKTA sponsored Western States Contest Announcement!

**Thrower** is a mailing list dedicated to throwing weapons. This includes such things as:

- [Knives](#) (Hi-res graphic)
- [Stars](#) (Hi-res graphic), and other [shuriken](#)
- [Spears](#) and [Atlats](#)
- [Axes](#)
- [Lariates](#), and [Whips!](#)
- [Bolas](#)
- [Boomerangs](#), and [Chakra](#)
- [Slings](#)
- [Waddies](#)

picture of throw

Thrower participants have, collectively, a wide range of experience with many [primitive weapons](#). As it happens, knives occupy 90% of the discussion. We talk about [choosing](#) a knife, [making](#) them (including [steel](#) sources), [caring](#) for them, [throwing \(how to\)](#) as hobby, sport, for hunting/survival, as a facet of [martial arts/self defense](#) training, and even [finding](#) them when they're lost! There are several files to get (see below) covering such topics as stances, throws, grips, custom and off-the-rack knife makers, catalogs, books, and other resources like this unusual source of throwers from [Jason Townsend & Son](#).

If you want to **SUBSCRIBE** to thrower, put **SUBSCRIBE THROWER** and nothing else in your message body. This mailing list is being run on **dfw.net** hosts. Check them out as an ISP, especially in the central Texas area. Say hello from me.

The links below will lead to many resources on the subject of knife throwing. Most of these links have parallel files that may be down loaded by subscribers to the thrower mailing list. These links provide much of the same resource to non-subscribers.

The text of **Custom** contains a list of by-hand knife makers that specialize in throwing knives. There is also a pointer to an atlatl maker.

The text of **Books** contains a list of book and video resources on the subject of knife throwing.

The text of **off-the-rack** contains descriptions of the knives I obtained from various mail-order catalogs. The Lee Larae **Knifecenter** has some of these on display here.

The text of **my custom knives** contains descriptions of the knives I own from the makers in the **CUSTOM** file above.

The text of **CATALOGS** contains a list of mail-order catalogs containing throwing knives and other throwing weapons.

My **TARGETS** contains a discussion of various target materials and target construction techniques.

A nice article on throwing **INDOORS** with **LIGHT KNIVES** by **Ed Sackett** covers implements, targets, and techniques. Enjoy!

An article about the **Master of the Blade**, Bob Karp, by **Gene Hauenstein** which first appeared in a 1996 issue of Tactical Knives Magazine.

Here is a short article about making a simple, indestructable **handle** for all steel throwing knives.

I have some pointers to **periodicals** that sometimes have articles or other information about knife throwing.

The **Garvin** text contains a few examples of throwing from Peter O'Donnell's Modesty-Blaise.

The American Knife Throwers Alliance, [A.K.T.A.](#), a club with a quarterly newsletter, some dues (\$20/yr), that sponsors knife throwing competition including a national event annually. Best thing is that membership includes a nice patch, a 20% discount on [Lowcountry Throwing Knives](#), and also a 10% discount on Harald Moeller's [VIPER](#) throwers!

☐  
Mail to [mjr](#), goto the [knife](#) page, or to [Survival!](#).

We are on the [Internet Yellow Pages](#).

These introductory things are always very painful for me, so I hope you don't mind me torturing myself a bit. My name's Chris Smith, I'm 48 and live in Coeur d'Alene (Core duh'Lane), Idaho, USA. That's near Canada and is a place of big lakes, rivers and forest woodland. I'm pretty happy, even when shoveling snow. I'd rather be in a hot spring than any other place on earth and that's why I live in Idaho. I still work irregardless, and have tended 'premie' babies, down to a 1/2 lb. that will fit in the palm of your hand. I'm a registered Respiratory Therapist with a perinatal/pediatric clinical specialty certification and have similar credentials for practice in Pulmonary Function Technology and Cardiopulmonary Technology. I've worked in the medical field for nearly 25 yrs, and I guess I've also worked with more knife and gunshot wound victims than most people. Not my cup of tea, anyway, my educational record is bizarre, with three 2 yr. Associate degrees and quite a few unrelated subjects. My transcripts read like: motorcycle repair, biochemistry, concrete, embryology, welding and mukluk making. If their was a degree program in Irreproducible Studies, I'd have my Masters. I've been politely and personally asked to immediately leave nice places by elk, moose, grizzly bear, rock slides, whizzing ball lightning and "the buzzing of the bee's" -- I'm not ashamed to tell you, I am trembling at the thought even now, which makes it all the harder to type. I can't rationally explain why I haven't died all the times I obviously should've, but whoever you are, I want to thank you personally - I recommend you highly to all. I've been a 60's Haight-Ashbury hippie, an American Marine with an Intelligence occupational specialty (I can't say much about that), have lived in a Zen monastery and used to be a fair rock climber. I still love my my old .45 and Ka-Bar Marine knife (well, it's true) and have a warm fuzzy feeling for shotguns, ancient cultures and the wrath of nature. I like handling bullwhips and throwing knives, tomahawks and axes. I'm a member of the Wild West Arts Club, a 600 member international stunt organization. I'm not all that good, but I do play. I've wanted to learn multi-strand braiding since I was a child and through the Thrower list have begun sling braiding which covers that nicely. Kind of a sportman's paradise where I live, so if you asked me to spear you a fish, I probably could handle it. I've been fortunate to meet and sometimes carea few celebrities, including Groucho Marx, Carole King and one large hawk in particular. I have the highest respect for people like yourselves (I know what I'm talking about here) and appreciate your company and experience, which is considerable. Thanks. Chris

I think that like boomerangs, blowguns have much too much fable attached to their effective uses. No, I'm not a user or expert with blowguns...but I do watch DISCOVERY and other such science TV shows. Details fail me, but not too long ago, I watched S.American natives hunt tree monkeys, using bamboo material BGs. Length:perhaps 6 to 8 ft. Dia. might have been 3/4" ID. Darts were dipped in poison, that attacked the money's breathing muscles. Native tracked animal as it swung thru trees, high above , and when the game stopped, hunter, pegged the bloke. I recall that the breath-power came from using the diaphragm to help propell the dart. On this same show(or one very similar) natives would use a very long, thin blowgun,12 or more feet long, and they would "snake" the BG thru the branches, getting right up to the bird they wish to kill, and then they pop the dart into the bird. Finally, cure'(this spelled correctly?) was not used against humans as salt was the antidote, so very easy to thwart the effects...I read somewhere. Looking forward to this new list. Bailey" Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, tbailey@IC.NET Subject: More Introductions Hi Everybody. I just subscribed to the Primitive Skills Group today. I found Chris' introduction quite interesting. I was a Haight Ashbury hippie too and I just a year younger. Chris, did we meet in the Fillmore West over New Year's in 1968? Anyway, I am quite straight now. I even have short hair and I am an Engineering Manager. Now you know what happened to all those hippies! My favorite hobby is boomerangs and throwsticks. I got into this primitive skills stuff as a young child growing up in Panama. The first toys I wanted my Mom and Dad to buy were the blow guns and shrunken heads that the Choco Indians sold at the border towns. I used to spend all my time in the jungle learning about the native animals and surviving on my own with minimal equipment. When I was 17, I left Panama and went to Arcata California to go to college. That was the beginning of my hippy days. 10 years later, I came out of the fog with a MS degree in Mechanical Engineering and I have been stuck in a middle class rut ever since. I throw boomerangs and put out a boomerang newsletter to keep me busy. I belong to the boomerang rang\_list and the thrower email subscription group as well. I look forward to hearign more about the other subscribers. Cheers. - Ted Ted Bailey || email to: tbailey@ic.net P. O. GROUP@vaxcha.uqac.quebec.ca, eaten\_by\_limestone@CLIFFHANGER.COM Subject: Introductions Hi I'm Merv (Mervyn Martin). I was born  
in Red Bluff, California and lack the strip between Izmir, Turkey and Taipei, Taiwan of having been around the world. I'm ex-Navy (14 years,  
that's how I got to travel) and now work, when I can find it, as an Electronics Engineer in Sacramento, CA. What else, oh, I'm 45 and have just  
taken on two more kids, a 15 year old boy and a 12 year old girl. What a glutton for punishment (that makes five kids)!!! Ah well, I'm half adopted  
too and I like my step dad! Chris, you were a marine?? Hmmm I can see some good flames coming here!!! :) :) Ted, I was stationed at Galeta  
Island, on the pacific side of Panama, for 2 1/2 years. Did you hear the tale about the Cuna Indians kicking the Guardia National's butt with  
blowguns? Seems that the powers that be in Panama wanted to annex the San Blas Islands. Well the Cunans were cool about it until the Guardia  
Narional started marching through the jungle to take the Cuna's home (the San Blas islands) away. The Cuna Indians drove the Guardia National  
out of the rain forest with nothing more than their blowguns. The Guardia was \_very\_ well equiped (m-14's, etc.) Poor Guardia. :) :) Now, this list.  
I'm fascinated with anything I can do with my hands. In the past I've done well at surviving with a knife. I say well, I gained weight. I'm a pretty  
good trapper and only scruple at swallowing uncooked bones. They're a bit scratchy (in and out). I can't say that I've tried grubs, but Caddis Fly  
larvae and Helgramites aren't bad. I've fished with, but not eaten Stone Fly Larvae (Toebiters). Always wondered who'd get the most bites. Salmon  
eggs aren't bad either, haven't tried frog eggs. I've info that may be of use. Like how to build a rope walk (a "machine" for the manufacture of  
rope). I'll need to dig out the text for that, it's an old Aussie book called "Bushcraft". Wow! Primitive Skills! Anybody wanna go fishing? Hook,  
Spear or Trap??? BTW, the main reason I can gain weight on a survival test is that I know the area and trap! Spinning cordage would be most  
important to someone like me. I've used mostly grasses and 1/4 to 1/2 inch thick. This stuff usually will take a jack rabbit (1/2"). Whew, I'd better  
close for now! Ya'll Take Care. Looks like a \_great\_ bunch of crazys here. Hey, any of you old hippies get to Mayday 1969, 1970 or 1971? Merv ---

GROUP@vaxcha.uqac.quebec.ca, eaten\_by\_limestone@CLIFFHANGER.COM Subject: Re: primitive direction finding Hi Fascinating, figured  
I'd hit the religous side too, but haven't seen that...yet. Chris, Andre, yes, I have had experience dowsing, both watching and doing. I can't say that it  
works all the time. Therefore Andre, i agree with the scientific side. I just have a problem explaining why it \_did\_ work those times it worked for me.  
My step father, who'd be grinning from ear to ear if he'd pulled a fast one on ya, says very seriously that he can dowse water wirth a bronze welding  
rod. I don't doubt him a bit. Personally, water has never really worked for me, but an underground wire especially with electricity running through  
it pulls the rods down very strongly. Just not every time. I don't know how to explain the times that work or what's different when it doesn't work.  
And yes Andre, I have a very deep and abiding respect for the Great Randi! There's a lot of pure bull out there, just to make a buck. I like what he's  
doing. The only explanation that I've read/heard that might have a possibility of being true is that the subconscious or unconcious mind really knows  
the answer that you're looking for and that dowsing is a way for it to communicate with you. So your own mind is whats controlling the stick, rod or  
pendulum your dowsing with. Nothing supernatural, just a method of communication. Andre, for your "flame", a question, did Schroedinger's cat  
care? :) :) Take Care All Merv p.s. Andre, how's your back??? M ---Time flies like an arrow ----- | Merv Martin \* \* |

06:30:11 EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32BD0DF0.4724@rand.nidlink.com> Date: Sun, 22 Dec 1996 03:31:11 -0700 From: Chris Smith Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, chriss@RAND.NIDLINK.COM MIME-Version: 1.0 To: Primitive Skills Group Subject: Re: Introductions Content-Type: multipart/mixed; boundary="-----23FC2C5C6DDC" This is a multi-part message in MIME format. -----23FC2C5C6DDC Content-Type: text/plain; charset=us-ascii Content-Transfer-Encoding: 7bit Merv (Ted), Yes I was a Gyrene (and it's a rotten crotch, as we say...hehehe). Yeah, all of the Ron Edwards Bushcraft books are good, very well illustrated. I think the book you mention is out of print - don't let me borrow it. However, there's a listing on this page of David Morgan's (he's the #1 man in whip making in the U.S - Harrison Ford's Indiana Jones and Michelle Pfeiffer's Cat Woman whips, etc. - scrupulously honest and a genius with braided leather): <http://www.davidmorgan.com/CATALOGS/DM/dm63?1234567890123456789112440387> It's not the homepage of his catalog (Braided Specialty Goods), but "Bush Leathercraft" is there, including ornamental knotting and David's own whipmaking classic and you can navigate around from there. Very good - he'll send you a catalog. Guy's a legend and teaches. Ought to meet him. I'd like to hear more about cordage and the "Rope Walk" rope making machine (since you won't loan me the book). Traps, deadfalls and snares...anything like would be appreciated (dole 'em out gradually). I've been weaving store bought cordage into 4 strand braids, like they use in the Andes for rope (or so I think) and it looks kind of cool, but a little labor intensive compared to a "machine," I'd think. Great abo blowgun story. Didn't make those Mayday's. Too busy. Ted asked if I made the SF Fillmore on New Years Eve. in '68. I was out of town, but I made the LA Shrine that year for the Frank Zappa and the Mother's of Invention Extravaganza over the New Years, that year, I think. Wowiee Zowwee!!! Grace Slick and the Airplane, Janis Joplin and the Holding Company, The Yardbirds (Eric Clapton, Rob Stewart, Jeff Beck and Jimmie Page, all at once), Quicksilver Messenger Service, Ten Year's After, Mobey Grape, Spirit, Blind Faith and Taj Mahal. Next day went to a free concert given by Janis Joplin and Blue Cheer in a park. Janis asked me if her monitor speaker was working. My tongue was hanging out. She was drinking Southern Comfort. Ask Matthew, he may have been at the Fillmore . Well, times have changed. I stopped hanging out like that when I found out for many, "living off the land" meant stealing the engine out of some guys truck. Not this kid. Spear fishing sounds good.  Another Introduction Date: Sun, 22 Dec 1996 13:21:24 +0100 MIME-Version: 1.0 Content-Type: text/plain; charset=ISO-8859-1 Content-Transfer-  
 Encoding: 7bit With all this introductions going on, I'd also like to give it a try, though I don't have such interesting experiences to offer like some of  
 the others who introduced themselves. I also came to this group via the thrower-list which I like pretty much. IMHO the only fault it had was, that  
 topics like the ones discussed here, couldn't be covered by it. About me: I live in Austria (Europ), particulary in Kitzbuehle in the Tyrolian  
 mountains. I am 23 years old and married now for 1 1/2 years. I have always been fascinated by \*primitiv\* technology and weapons. Since I was  
 very small I have been toying around with knives, spears, blowguns, slingshots and slings. I also like all aspects of shooting, and owe quit a number  
 of firearms, but the power and accuracy one could get with weapons made from the simpelest components have never ceased to amaze me. Survival  
 is also a topic which I find very interesting, and the question of another member of this list stated in his introduction on what to stock up for a  
 naural desaster would interest me very much. One other thing I am thinking about is primitv leather-making. I have read about how to make  
 rawhide (by rubbing it with ash, rolling it up...etc.) but how does on cure a fur so it is soft and durable and can be fashioned into clothing or  
 something? I am looking forward to more fascinating discussions with all of you. Thank's Doc for making this possible. Greetings, Alexander J.  
 Pirchl Jochbergstr. 6 A-6370 Kitzbuehel

 primitive-skills-group@uqac.quebec.ca Subject: Yet Another Intro Content-Type: text/plain; charset=us-ascii Content-Transfer-Encoding: 7bit  
 Hello all, I am very pleased to be a part of this group. I am a 23 1/2 year veteran of the US Army currently serving with the Virginia National Guard  
 and will retire in about 2 1/2 years. I am wondering if we are seeing a pattern develop here of the personality types that are interested in this  
 subject? I was raised by both my own parents, Dad a forester and Mom a teacher and librarian, joined the Army out of high school, was a linguist  
 working in intelligence, also served as a supply sergeant and in the infantry, was literate in Korean and Chinese, semi-literate in French, barely  
 literate in English (especially after 5 years in Korea) and now the computer guru for my Brigade (if only they knew how little I really know). My  
 hobbies include (when I can find the time): archery, hunting, shooting (modern and blackpowder), reloading, running (occupational), swimming,  
 biking, computers, reading (voraciously), history (was my Brigade's historian), and community service. I am now starting to build primitive bows  
 (an outgrowth of my interest in archery, I have been shooting since I was 10) which lead to an interest in flintknapping (led to this list by post on  
 knappers list), which has led to interest in the subjects this list should be exploring. Many thanks for starting this list. I hope to learn alot. Also,  
 I would like to say that I don't believe that there is such a thing as a stupid question. No questions, no answers. I should also let you know that I am a  
 little blunt. -- Sincerely, Barent Duty, Honor, Country

Burdine) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, jburdine@PIPELINE.COM Subject: Re: Blowguns The .625 blowgun is sold by J.W. Mcfarlin Co.;P.O.Box 209; Lake Havasu City, Az 96405-0209. It is supplied with nail and fairly thick wire darts with plastic cones and injection molded stun darts that work very well to chase pests and can be very interesting for games of bug tag. They hit hard enough to create an inch wide welt, or stun/kill birds up to the size of a starling.For those not of the techno-primitive bent it would be fairly easy to cobble up darts of dogwood shoots,dowling, or splits from suitable wood(with a froe or other similar tool) Birchbark would indeed make an adequate replacement for paper with pitch for glue. Still if I were to turn to gathered materials, I would probably make them much as the Cherokee, and Creek indians did with thistle down tied on with sinew or fiber cordage. If you are lucky enough to live in the Southeast there is river cane. Elsewhere you might turn to a straight sapling of another type of about one inch or so in diameter at its narrowest point. With the cane you bore your way through or grave and split then scrape out the sections, and then glue and bind together. With the sapling you will have to split lengthwise through the center and then scrape out your channel through the center in whatever diameter you want. I would advise about .50 inch inner diameter or perhaps slightly bigger. I have no local sources of cane, and so rely on neo-primitive sources such as the hardware shop for sources of hard copper, steel, or aluminum tubing. For a mouthpiece I use either cane tips or stool leg tips and hot glue them into place. I rely on dowling or bamboo skewers in about 1/8 inch in diameter and either tied on cotton or acrylic yarn to fletch the dart. The tips are scraped to a point, and will penetrate card board or other fairly soft targets. My sources of information for my blowgun studies are A SPORTING CHANCE by Daniel P Mannix (1967) AMERICAN INDIAN ARCHERY by Reginald and Gladys Laubin(1980) AIRGUN DIGEST both the first and second editons WOODSMOKE compiled by Richard and Linda Jamison(1994) has an article by Steve Watts titled "The Ultimate Weapon-The Southeastern Indian Rivercane Blowgun" They also have an article on the fire piston. BLOWGUNS THE BREATH OF DEATH by Michael D. Janich(1993 Paladin press) with a dramatic title but actually has a pretty solid description for the neo-primitive that wants to make a blowgun. I've seen Laubin's book at local bookstores as a new release paper back. Neo-primitive is my own label for people using primitive techniques today but not necessarily with traditional materials. JB

Burdine) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, jburdine@PIPELINE.COM Subject: Re: Blowgun poisons >>Do you or anyone know what poisons were used by primitive people and how >the heck it was >manufactured? > Andre; I've read about various toxins used by aboriginal peoples for various purposes, such as the strychnos toxifera plant that is the source for curare, and using certain plants as fish toxins in fairly sluggish pools of water( ibelieve it was walnut hulls), but as for having actual experience in using them I have to say no. If I were to use a poison for hunting larger game I would probably turn to the most readily available vegetable toxins or nicotine sulfate from a concentrated tobacco slurry. Nicotine attacks the nervous system of the animal and would cause death after a short time from a fairly minor wound. I would have to really work on my tracking skills though. I would also cut out the meat immediatly around the dart wound to reduce the amount of toxin ingested JB

1806 N 3rd Room EM,Monroe, LA 71201 > FREE CATALOG.....sent anywhere! > \*!"Let the good times roll!" Cajun French saying. > >>>>>>  
 bmanrich@iamerica.net<<<<< I saw the same program. My understanding of why toxins are not used against men is because it's not done,bad juju,  
 dishonorable. Pick one of the above. I use medications derived from curare fairly frquently and they are often given to people via Sterile saline(salt)  
 I.V. drip. We wouldn't do that if slat deactivated it. Curare attacks the stuff that carries neural transmissions across synapses. Neural transmission  
 is enterupted and the animal can't breathe. Works on men the same way it does animals, and get this, you are fully awake, and feel everything as  
 you smother to death on your own weight. That's why we put people on ventilators and sedate them so they aren't terrified about their paralysis. JB

14:52:04 EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: MIME-Version: 1.0 Content-Type: text/plain;  
 charset="us-ascii" Date: Sun, 22 Dec 1996 11:52:39 -0700 To: Primitive-Skills-Group@uqac.quebec.ca From: jburdine@pipeline.com (James E.  
 Burdine) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, jburdine@PIPELINE.COM Subject: intro I am an R.N. that works  
 in a Surgical ICU course,but I also have past experience in the E.R. I've been enterested in survival and primitive technology ever since I made my  
 first bow from a cherry branch at the age of 5 and had the same bow broken over my backside after a shot went wrong. On my mother's side of the  
 family is Hessian German, and my mother still talks about the war years and things they did to survive hard times.On my father's side is Scott/Irish  
 and Am. Indian(either Cherokee or Blackfoot depending on who you ask) So I am quite happily a mutt. My Dad tell stories about the big  
 depression, and humorous experiences from his 30 years in the Army( but would not until recently talk about his experiences in the Korean war)  
 I've rubbed elbows with some of the finest survivalists in the U.S. from the Rangers, Special Forces, and Force Recon(who talked to me even though  
 I was a leg army puke) I messed about with throwing knives, bows, firearms of various types and .38 cal blowguns. I learned to fish, and camped  
 with the Boy Scouts. I learned how to make a warm bed in nothing but a pile of leaves(pile them up,dive in gently, and wait until your body heat  
 creates a pocket of warmth) What struck me as a disadvantage about survivalism is that most people seperated from their kits would not be able to  
 survive, because older methods of survival had been lost. I felt that one should be able to be dropped anywhere in the wilderness and be able to  
 scrounge up materials needed to sustain life.Thus I started reading everything I could find about primitive technology, including what I call neo  
 primitive technology. Neo- primitive technology is old techniques with non-traditional materials. For example slingshots use traditional bowhunting  
 techniques with a high tech substance (vulcanized rubber) or using steel tubing to make a blowgun. Well that's enough hot wind for now. JB

Meanwhile, > anyone that is succesful, let us know!! >> I'm pretty sure Ben Pressley knows about this more than I do. >> Andri Read something about the fire piston somewhere else but I checked the web site to be sure. I am not sure if it was in American Survival Magazine or somewhere else, looked but couldn't find it right off. One of the things that I remember is that the tinder was "picked" out and that it was now used to light cigarettes! I think that the author had traded for one made of palm. Actually it works like a diesel engine and similiar principles apply. You would need tight fitting to create the pressure needed to heat the air, also a sharp, quick stroke would probably be most successful. I think that I might try this after the holidays, might have time then. -- Sincerely, Barent Duty, Honor, Country

They are also called "Poison Arrow Frogs" They exude toxins from their skin when they get upset. You can play with them in your hands if you do not crush them or eat them. The natives put them on a hot stone to make them mad, then, they rub their darts on the skin to make really potent darts. The natives in Panama also boil a vine that grows at the edge of the rivers and dump the "tea" into a slow stream. For some reason, the "tea" is a toxin that prevents the fish from getting oxygen to their gills and they float belly up. I found that M-80s and hand grenades were more effective means to catch fish and were probably more environmentally friendly as well. Ted Bailey || email to: tbailey@ic.net P. O. 22:27:43 EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32BE09C8.2085@perigee.net> Date: Sun, 22 Dec 1996 22:25:45 -0600 From: benjamin@Perigee.net (Benjamin Pressley) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, benjamin@PERIGEE.NET MIME-Version: 1.0 To: jaykidwe@iglou.com CC: Primitive-Skills-Group@uqac.quebec.ca Subject: Eating Insects Content-Type: text/plain; charset=us-ascii Content-Transfer-Encoding: 7bit I can only speak practically about insects in the U.S. however, it is my experience and also from things I have read that any insect is edible. Priority-wise you would want to avoid insects with poison and stingers, however, there are ways to prepare even these, similar to eating venomous snakes, remove the poisonous parts, then prepare the rest of the insect. Of course this means having a knowledge of where the poisonous insects poison sacs are located. You also want to remove all parts that would hang in your throat, like legs and wings. It is also best to remove the head in most cases. All wild meat should be cooked thoroughly, for wild animals contain parasites that can get into your system, this includes insects, even small ones. Insects may be roasted and ground to a powder an mixed in a stew with other edibles. This is more palatable in most cases. This is also practical whenever you have several small things to eat, to make a stew and drink the broth and whatever is cooked in it. In some cases you can even strain out the solids and drink the broth for nutritional value. Most insects are high in nutritional content, like grasshoppers. Grubs are high in fat and nutrition. One thing to keep in mind in hunting any animal you are going to eat is to never expend more energy in capturing it than it is going to give back to you upon consumption. Observe when insects are least active, if they are a type of insect that is particularly active, like a grasshopper. Grasshoppers crawl to the top of grass blades during the night and become very dormant and still, They are most easily captured in the early morning, while still dormant and smacked with a twig and gathered into a basket or pocket. I have read that Indians would drive the the grasshoppers across a field to another group of Indians waiting with dried grass in a

row across a field that they would light and roast them on the spot. I have not trested this, o, I don't know how practical it would be or if it even works. It could be heresay. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca TRIBE Homepage: <http://users.aol.com/tbprim1/Tribe.html>

---- Dowsing from my experience with people who claim they can do it is not a teachable skill that can be taught and repeated consistently, if indeed  
 it can be done at all. If we are going to discuss direction finding, I for one would rather discuss techniques we all can repeat and be more mutually  
 benefitted by. I'm not trying to be disagreeable, just practical. I for one would be glad to share such techniques that have worked for me and would  
 love to also expose some myths that you read about in so-called survival manuals, obviously not written by people who have field tested these  
 techniques. What say the rest of the population? ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-

 benjamin@PERIGEE.NET MIME-Version: 1.0 To: Primitive-Skills-Group@uqac.quebec.ca Subject: INTRODUCTION Content-Type:  
 text/plain; charset=us-ascii Content-Transfer-Encoding: 7bit Just an introduction to anyone I haven't met yet. My name is Benjamin Pressley. I

teach primitive, survival and wilderness living skills. I write for several magazines like American Survival Guide, Backwoodsman and Wilderness Way. I co-founded an organization called TRIBE that now has members in 46 states, Canada, New Guinea and Guam. I publish a newsletter for TRIBE also that many of you will find interesting, I'm sure. We are a network that operates non-profit to connect people interested in primitive skills with resources and other people. I am skilled in many areas of primitive skills. Shelter building, fire making, water sources, some edible and medicinal plant knowledge (enough to get by), tools from stone, shell, bone and wood, braintanning animal hides, traps and snares, fishing technologies, cordage making, lighting methods, cooking without aid of modern utensils, and much more. Hunting Weaponry is particularly an interest of mine. I teach classes year-round and do a lot of demonstrations for schools, museums, etc. The particular weapons that my research has been in are slings, bolas, atlatls, non-returning throwing sticks, blow guns. I will be glad to help out anyway I can with questions, etc. If you are interested in primitive, survival and wilderness living skills that I have please inquire. My skills are based on skills used by primitive people for thousands (more?) of years. If you want more information about our organization, TRIBE, check out: <http://users.aol.com/tbprim1/Tribe.html>. Ted Bailey does this homepage for me. As I get more Internet/Web page savvy I plan on putting out a mini-newsletter for people interested. For now, check out that site and it will tell you more about what we have to offer. Well, enough for now. I'm looking forward to interacting with everyone in the Primitive Skills Group list. My thanks to Andre for getting it set up. ----- Benjamin Pressley

I suppose any bone would do, though, that you can grind down flat or small enough in diameter where you don't have a huge hole left in the material you are sewing. Before grinding, though, drill your hole for receiving the thread first, then grind the bone down around it. The reason for this is that the needle will split if you try to drill it after you make a needle. Better to grind it while you have plenty of bone than to spend all that time grinding to only have it split on you when you drill it. >=20 However, the method I use most for sewing in a survival, primitive situation is to grind a bone to a point and use it as an awl. Use the awl to pierce a hole in the material to be sewn and then feed your thread or thong through the hole. You make your thread pointed in the case of a thong to make this easier. Bird bones (particularly wing bones) work well in this application for use as awls. Any bone will work, though as will a sharpened stick or a sturdy thorn. >=20 ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca TRIBE Homepage: <http://users.aol.com/tbprim1/Tribe.html> Snail Mail: TRIBE P.O. Meanwhile, > anyone that is successful, let us know!! >=20 > I'm pretty sure Ben Pressley knows about this more than I do. >=20 > Andr=E9 THE MAN to talk to on fire piston is my friend 'Mountain' Mel Deweese. He is pictured in the Woodsmoke videos doing this and I have personally seen him do it many times at our annual event, TRIBE Gathering. If you wish to contact 'Montain' Mel: Mel T. Deweese, 1825 Linden St., Grand Junction, CO 81503, Phone: 970-242-8507. If you want to see the Woodsmoke video you can order it from: WOODSMOKE, Richard & Linda Jamison, 11401 Willow Hill Dr., Sandy, UT 84092, Phone: 801-571-1790. The video is entitled "Fire III" and also covers fire saw, fire thong and fire plow, price is \$34.95+\$3.50 S&H. They also have a book that discusses it entitled "WOODSMOKE: Collected Writings on Ancient Living Skills" for \$15.95+\$1.50 S&H. Fire piston requires a very title piston with a handle that is quickly inserted into and removed from a chamber that contains it that also hold a tiny bit of tinder (Usually a type of palm frond tendrils). Done correctly the forcing of the air molecules are caused to compress so rapidly that you virtually achieve spontaneous combustion or at least a glowing ember. Japanese commonly use brass cylinders of this type for lighting cigarettes. Mel used one carved from Buffalo horn.=20 ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca TRIBE Homepage:=20 http://users.aol.com/tbprim1/Tribe.html Snail Mail: TRIBE P.O. Would I have to >dry the leaves prior to attempting to separate the fibers? Yucca fiber wadded up and dried is a \_great\_ wash cloth too! I bought one at an Indian village in Mexico (close to Tamilpas) and wish I'd bought a case! Try it both ways, drying first and not. As I remember the leaves are pounded on a metate, (Read as pounded just enough to crush the leaf and separate the fibers, no jackhammers allowed!) Then the fibers are separated and dried. Of course they are hung on previously dried yucca fibers Now, save the sap for soap and shampoo (high saponin content), and if it starts to ferment, well save that too, for medicinal purposes only...of course! The point at the end of the leaf can be bent and pulled 'till it separates from the leaf except for a fiber that'll stay with it. Pull this fiber carefully back to the base of the leaf and you'll have a pretty good needle and a foot or two of thread. Saw this done in Mexico at a tequila factory tour and I don't remember whether to pull the point up, as the leaf grows, or down. I guess you'll just have to try this stuff. (I know, I know, tough assignment, but someone has to do it! :) :) ) You need to see the needle and thread to believe what the effect is. Scrape green leaves with a dull edge, like the back of your knife or pull leaf back and forth over a limb. As all the 'green' (that's scientific, isn't it?) is removed you will be left with some really nice fibers to cord. Dry, it is only a matter of rubbing away the dried material. There are many varieties of yucca. Some stalks also contain a multitude of fibers in some varieties. If you don't know how to cord the fibers for strength, let me know. I don't know if I can explain it adequately, though, in this medium. I would be glad to send you an instructional drawing of mine, however, for \$2 to cover copy, S&H. Just write me at below address. -----

Poke a stick firmly in the ground, long or short I don't think matters, long may be more accurate. Mark the position of and measure it's shadow with another stick. It's a good idea to break the measuring stick at the shadow length point. Hang around a few hours until the shadow of the upright stick is the same length. Mark again. If you're in the northern hemisphere, a line drawn from the upright stick and a point half way between the two marks (closest distance) is north. In the southern hemisphere, of course it's south and on the equator, you need more info. :) :) It might be helpful to know what season it is in the tropics too. You could possibly be north of the equator and get a line that points south. If you're in the northern tropics, the sun will be north of you for some part of the year (by definition). Same problems in the southern tropics. I don't know how to solve the tropic problem unless you have a handy whirlpool close, or know the season. It was noticed that when they were discharged in the dark the air guns gave off a light. Later tinder was ignited using the heat generated by charging the airgun." [Have you tried this? Is it practical? Anybody got an airgun and some tinder? Maybe a tinder holder for an airgun's business-end might be a clever add on. Direct the gas flow through a small inline turbine to fan the flame, maybe ramp up the flow with a narrowed exit outlet (auto needle valve if there's not too much flow resistance) -- hehe... somebody stop me!] The article summarizes the literature, adds more to Mel Dewese's fire piston story, shows plans, gives the Woodsmoke/Video contact info, tells where to get a ready-built fire piston from Bob Perkins at BPS Engineering, etc. Mention is also made of the fire plow and fire saw. If this isn't too far off-topic, what are those? Sorry about writing about you in the 3rd person, Wyatt. Nice site, great page. Chris

As I remember the leaves are > pounded on a metate, (Read as pounded just enough to crush the leaf and > separate the fibers, no jackhammers allowed!)... Yucca stalks are practically all fiber, too. See if you can pound some of that down, if you ever take one down. Odd cactus handling story: Friend of mine named John lives in a place called Millard Canyon in the Southern Californian mountains (used to live right there, too). Place is frequented by Christopher Nyerges (gratuitous plug here): School for Self Reliance <http://home.earthlink.net/~nyerges/> Anyway, John's a big wild man and takes his chainsaw to a whole hillside of Maguey cactus at his cabin (big jade green - sometimes green and yellow - 5 ft. long sword leafed pointy thing they make tequila with). The cactus juice aerosolized all over the place until he went anaphylactic and nearly died. OK, well...take the machete route, like they do in Mexico. That's my advice. I've stripped off fiber strings from the tip and this stuff is great, though I haven't used it for needle and thread work - crossed my mind. Funny thing, I lived across the creek and my other neighbor was an animal importer with a large glassed rain forest habitat full of those tiny fluorescent-colored poison Panamanian tree frogs you guys have been writing the Cuna Indians rub on their blowgun darts. Guess you can buy them and breed them... 'course he had cobra's there and the rattler's lived loose in the yard. Chris

Would I have to >dry the leaves prior to attempting to separate the fibers? >>-->Sincerely, >Barent >Duty, Honor, Country I had to look for a reference to find this,PRIMITIVE FIRE AND CORDAGE by John McPherson stated "The leaf of the yucca gives the strongest cordage of any of the plant fibers that I have worked. It is also easy to work. It has the added advantage of being usable when green or dried. With the yucca leaf, the fibers are in the inside. Take the dried leaf and beat it gently to seperate the fibers some. This helps it to soften faster while soaking. Then soak the pounded leaves until they are supple. When like green,or if green, take a rounded knife blade( flint or other wise) and scrape the outer covering from both sides(the soaking makes this easier with dried leaves). Then work the fibers loose by rubbing back and forth with your fingers. Superb cordage material." Touch of the Bear JB =====

| > -----Fruit flies like a banana--- It sounds like a great subject to me. Pottery is not as hard to produce in a survival situation as many think. Although, it does require gathering usable clay (usually easier found than most realize), proper tempering (sand, burned shell; 25%), proper construction (Pottery being used for cooking must be more carefully formed than artsy pottery), it does take a 4-7 days at least of drying time before it can be fired, proper pre-heating and at least two firings. I'd be glad to discuss this subject in more detail. Because of the time needed pottery would definitely be a pursuit for a long term camp. Short term it is more practical to use other methods of cooking, which would also be a great subject for discussion. As far as boiling or cooking a stew, like you would use pottery for can be accomplished by hot rock cooking in a wooden container produced by burn & scrape methods or a rawhide container that is suspended over hot coals (It does drip though. If you hot rock cook in it it does not drip) or line a pit with a rawhide and hot rock cook in it (Make sure you use a fresh hide to do this, right off of the animal. This method also cooks any remaining flesh clinging to the hide into the stew, where it won't be wasted.) ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca TRIBE Homepage: <http://users.aol.com/tbprim1/Tribe.html> Snail Mail: TRIBE P.O. My name is Russ Brownlow and I've lived in Texas my whole life. Just moved to Houston after being in Austin for 8 years. I'm pursuing a master's degree in archaeology, possibly a PhD after that. I've been involved in wilderness survival pursuits since I was a kid in Scouts. I became an Eagle Scout at 16 and have been roaming the wilderness since. I'm not a hardcore militant survivalist, but I usually work deep in the woods, so I get along OK. I haven't had to eat any bugs to survive though. I'm an archaeologist for a company out of Austin, and we do surveys, testing, etc. across the country. I wasn't around at any of the concerts you guys were talking about, but I might have been conceived at one of them early in '69. Although I'm not a true hippie, I like to think that I would've fit in well back in the day. That should do it for now. PEACE, ^/\ /\ /\ /\ Russ \ ( \_ ) ( ( \_\_\_\_\_ ) ===== Archive-

Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable Hey everyone, here's something new and exciting. I just about had an=20 orgasm when I read about this! Thanks to Ben Pressley for bringing it to my attention. Folks, please=20 try this one for me! (I can't because I broke my spine a couple of weeks=20 ago playing hockey. I'm well on my way to full recovery now, there will=20 be no permanent damage, the doc confirmed this yesterday, but I have to=20 wait at least two more months without doing any strenuous activity=20 whatsoever. Thanks to all who have shown concern...) BEN PRESSLEY WROTE: Andre, I'm just sending this to you, you can send it to the rest of the group, if you want. I noticed in your intro to the primitive skills group that you mentioned you had not found any firesaw material successful where you live. Try this, Barry Keegan and Mike Fairbanks came up with this one. Remember the New Guinea fire saw we played with at TRIBE Gathering with the bamboo strip and basswood hearth? Remember you came up with the idea to elongate the strip by using two other attached bamboo sections for handles? Well, Mike Fairbanks was one of the guys there that successfully made an ember, well later on he came up with the idea of taking the split open, wedged open hearth, made from any soft, dry wood in hand...stuff it full of tinder, loosely...make a pinky sized impression in the tinder to receive the ember...take this hearth in hand and rub it up and down on a wedge of any hardwood jammed into the ground vigorously...and if you are good as Mike or Barry, you'll have an ember in 10 seconds lodged in the opening you made in the tinder bundle! I may have sent you a copy of Barry's drawing on this in the stuff I sent you, if not let me know. It will also be in the next TRIBE newsletter in March. Barry is ready to give up hand drill and bow drill for this method, he says it is so easy! -----

----- Benjamin Pressley benjamin@perigee.net BEN, let's find a name for this technique! How about the fire hole? =20 What does Barry Keagan or Mike Fairbanks call it?  Welcome Russ, I'm sure I'll ask you questions from time to time. Sounds like you work for an oil company, right? In your work have you found any Native American artifacts, like knapped lithic projectile points, pottery shards, mummy's and the like? Any evidence of weaving or braiding discovered in your excavations? What tribes and cultures have you encountered in your 'time-travels' as an archeologist? How's that for a start . I must be responsible for this old hippie thread. Sorry. I'm about as far from that as you can get now (though I'm the Godfather of a clown), it was way different, but that was another time. I also used to make 500 lb. napalm bombs and became a Marine - I guess my bio hasn't reflected perfect ticket-punching, but I try now (...and that's my story and I'm sticking to it). I hope no one feels they have to exchange old hippie stories. I'd rather crawl under the rug and die (ha). Glad to hear from you on this neat list. Chris

Andr=E9, M-80's are usually illegal fireworks, like firecrackers - well they can be bought some places (where I live) with out a blasting license, but they're not considered "Safe & Sane." All of mine have been barrel shaped and had waterproof fuse placement at the center of it's length. Gun-powder filled, it's basically close to a quarter stick of dynamite in effect. Another story (Groan): When I was a kid, our anti-social next door neighbor brought his dog to my yard to do his business everyday (sometimes twice), which I had to clean up after (for years). One day after the deed was done, the pair continued on past my house...until my brother and I tossed an M-80 after them. The shock wave was visible and knocked them both off their feet. I was impressed. They gave us a wider berth thereafter. I also must admit to throwing a perf'ed can of powdered metallic sodium into the city pool, soon after. The depth charge-like explosion (higher than the high dive - it went KaWhuumph!) was impressive and I'm sure could have brought up quite a few fish if tossed in the right place. Chemical supply house's should be possible to find, up your way. Any chemists out there with the correct chemical name for this? Not too primitive, but it'll fit in a expedition pack. -- Chris

If this isn't too > far off-topic, what are those? >> Sorry about writing about you in the 3rd person, Wyatt. Nice site, > great page. >> Chris I haven't tried the air gun, but the fire piston goes back farther than that. Fire plow is basically a board that is rubbed vigorously with a stick digging a trough into the board (hearth). The friction builds up heat and grinds hot wood particles that gather and form into an ember. I personally have not used this method yet though. I have used the fire saw, though. There are many variations of the fire saw. The most well known is splitting a 4 foot length of bamboo lengthwise. Tinder is held in one half. The other half is driven into the ground and held against the chest or abdomen. The half holding the tinder is rubbed vigorously across the other until the wall breaks through with heated particles that are basically your ember that can be blown into a flame. It is really difficult to explain thoroughly in this medium. Also I must depart for now and I will address other variations soon. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. Maybe this would > > work with airguns too? >=20 > Andr=E9 Thanks to Andr=E9 and all the other list member that have given feedback on this question of mine. I think, that if barrel lube can produce muzzle flash with an airgun (as seen after dark) than a little barrel lube may be a way to get some contained tinder started. I reason that the gas compression from an airgun's cylinder may be greater than that produced from manual operation of a fire piston. I figure the muzzle flash might be either attributed to electrostatic discharge, ignition of the device's petroleum based lubrication or simple ignition of airborne dust particles. As for a muzzle-end tinder containment add-on, I agree that a captive plug with a blind-end would be best for gas compression, but would likely blow off like a pop-the-cork toy gun. Radial (small side ports) venting (screened possibly) might be sufficient for enough compression to ignite tinder. However, putting an air gun up to a socket on a fire piston should also work. Thanks, this has been fun. Chris

Why on earth would you do it? I don't doubt the effectiveness or ease of the methods, but there are many drawbacks which I think outweigh the advantages. One, for the use of bombs/grenades/explosives, most of the fish stay on the bottom of the water formation (lake, sea, stream, etc.), so you are getting a relatively low yield percentage-wise. Around 5-10% usually. Second, and I believe this applies to all mass-killing methods, it does a great deal of harm to the ecosystem that you use it in. What is the point of killing 1000 fish at once, having half of them spoil, and then having none left for next spring or whatever. Not to mention that none of these are really a primitive skill :,) but that's beside the point. -- \_\_\_\_\_ ||| Neal McSpadden mcspadde@clark.net ||| http://www.clark.net/pub/ngami ||| Nga Mi Son Phat Gia Quyen http://www.clark.net/pub/ngami/kf ||| Director of Research @ http://www.hanwei.com || the Han Wei HomePage | -----

00:13:11 EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32BE7781.3CB0@saglac.qc.ca> Date: Mon, 23 Dec 1996 12:13:53 +0000 From: Dr AF Bourbeau Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, bourbeau@saglac.qc.ca MIME-Version: 1.0 To: Primitive Skills Group Subject: Tinder for fire piston and flint & steel Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable I have been communicating with Wyatt Earl who wrote the article on fire=20 piston and was asking him about tinder other than charred cloth. Our=20 communications might interest some of you... here goes. Howdy Andr=E9! First, thank you so much for your generous and kind appraisal of my fire piston article. It was a lot of work but very fun. I am glad that you brought up the question of the shredded bark tinder that was mentioned in the article. I was reporting what John Rowlands said he used but in all my years of experimentation on the subject of catching sparks I have never had any succes with the dry, finely shredded bark. In addition, no one who is into primitive tech. that I have talked to has indicated success either. Ditto for mouse or birdnests. I have only had success with charred material. The only thing I have seen that is uncharred that will catch and nurture a spark is a type of fungus that is sometimes found in birches or cherry trees and it is amazing to see. Because of your question I am going to edit my article to indicate the above observations. I appreciate you input and look forward to further conversations as well. It sure would be fun to make a living writing things like that firepiston article. Happy Holidays, Andre Hi Wyatt, You might like to know that I have finally identified that birch fungus=20 you are talking about. It is sometimes called Chatoquin or Bearshit but=20 the scientific name is Innonotus obliquus. It is indeed a fungus (at=20 first I thought it was a disease) but it is a white rot fungus rather=20 than a brown rot like most rots we usually see. This white rot attacks=20 the wood lignum and cellulose differently than brown rot and is=20 responsible for forming a material which is similar in many ways to=20 charred cloth. I am still looking into this and trying to find other=20 fungi or material botanically related to Innonotus to try them out. =20 Maybe this will help you with the tinder issue and maybe you and others=20 can help pursue this research further. Innonotus was also used medicinally in Russia, one source mentioned that=20 (can't remember off hand, but I did write it down somewhere). For tinder, this stuff is indeed amazing. One very fine spark into it=20 and you can't put it out! However, I've noticed that if it dries out=20 too dry, it no longer works. Much testing still to be done... Best regards, Andr=E9 PS We've got a great primitive skills group with many very knowledgeable=20 leaders, you are very invited to join us! --=20 ----- Surviving at nature's will...=20 Dr Andr=E9-Fran=E7ois Bourbeau =09 Professor of Outdoor Pursuits University of Qu=E9bec=20 555 University Boulevard=20 Chicoutimi, (Qu=E9bec) CANADA G7H 2B1 418-545-5011 Ext 5259 At Nature's Will Inc. 3801 Rang St-Martin Chicoutimi, (Qu=E9bec) CANADA G7H 5A7 418-543-2888 bourbeau@saglac.qc.ca -----

An M-80 is a very large firecracker. They float, so you have to weigh them down. We never used them in small streams, just the large rivers. They would kill or stun fish at a range of about 10 feet. Great way to get bait for shark fishing. I really don't want to encourage this. I just wanted to make a statement that it is an option if you are desperate for food and have small explosive devices. When I was a teenager, I lived in Panama and used to work on merchant ships during the summer. In 1968, I took a trip on a Victory ship to Viet Nam. At the mouth of the Saigon River there is a port called Cape Jacqu=E9s (sp?)= =2E Ships would anchor there overnight before making the trip up the river to Saigon. It was imperative that you did not go up the river at night. The entire time we were waiting at the mouth of the river, small U.S. Army boats would circle the ship and throw a hand grenade into the water every 10 - 20 minutes at random locations and intervals. This was done to stun any Viet Cong divers that would approach ships to place explosives. That's all I know about fishing with explosives in S.E. Asia. - Ted Bailey Ted Bailey || email to: tbailey@ic.net P. O. Upon further reflection we are talking about finely shredded bark as FIREPISTON tinder aren't we? My experiments were with flint and steel methods of firemaking & I've had no success with uncharred material. But I remember a conversation I had with Bob Perkins, an engineer who makes firepistons, and he said that over in the Asian areas where the fire pistons were in use they only found the fine "Hairlike fibres" of a certain kind of palm or bamboo frond would work. It was something indigenous to that area and it seemed that firepiston use was confined to places where it grew. Still I think an amendment to the article is in order so as to share the information. Welcome! I believe the fishing with explosives thread started when Ralph (I think) mentioned that a couple M-80's might not be a bad idea to include in a survival kit for last ditch fishing. Small and with a high likelihood of obtaining significant calories. They are relatively small as explosive charges go and damage to the ecosystem would be limited. Fishing with dynamite is practiced sometimes in Mexico, I can tell you ("Special Mexican Bait" it was called). I think, chemically speaking, a small metallic Sodium canister might be the most environmentally "friendly" type of explosive reaction. The water would get slightly saltier temporarily and hundred of fish kills would be unlikely, up and down a waterway (which no one here wants - hunters have a big interest in Conservation as a lifestyle). On the downside, DO NOT get metallic Sodium wet, until you're really ready. Not Primitive, but I believe the topic can stray to modern survival items that at least can be thrown into a backpack to edge one's bet. However, there ARE backpack carried tactical nukes...I can see your point about drawing the line somewhere . I admit, I'm addicted to technology, as a recent widespread prolonged power outage taught me recently with a couple days of 20 below (F) temperatures and lights out. I'm here to learn from these luminaries. I'm filling up my hard disk rapidly with all these topics I'm saving. -- Chris

On the downside, DO NOT get metallic > Sodium wet, until you're really ready. I suppose I was thinking of a different type of explosive fishing. The fishing I've seen done with explosives used grenades and other high explosives that did massive damage to the environment and the fish. Although I think it would still be a last resort kind of thing. > Not Primitive, but I believe the topic can stray to modern survival > items that at least can be thrown into a backpack to edge one's bet. > However, there ARE backpack carried tactical nukes...I can see your > point about drawing the line somewhere . Please step >forward, so we can pick your brains from time to time. I do OK with >plants and know enough to survive, but there are so many I know that >know so much more than me. Got info and can dig up a few for ya. It'd be easiest to set up categories for treatment. Like burns, breaks, upset stomach, aches and pains... \_DO\_ be careful, a plant called foxglove grows in North America. It's generic name is Digitalis (specificly Digitalis purpurea). Note the name Digitalis. Sounds like heart medicine doesn't it. It's the source of digitalis. That's just one. One of the basics to carry with you is the bark especially the inner bark (cambium) of the willow. White willow seems to be the best, but all have a chemical called salicine. It's the natural form of aspirin (aceetyl-salicylic acid). So whatever you use aspirin for you can substitute wilow bark for. The leaves work too but are a different strength. Now, be careful collecting the inner bark, If you cut away the cambium layer all the way around the tree (called girdling the tree), you'll kill it! That's it's blood system. As far as dosage, I need to dig for some definitions and will post after Christmas. Speaking of that Merry Christmas to all and to all a prosperous New Year.  charset=us-ascii Content-Transfer-Encoding: 7bit Since someone asked about producing pottery. I thought I might send out a few notes on the  
 subject in parts over a period of time. I'll break them down in categories as Andre suggested so he can keep track of the threads for future reference.  
 I thought I'd start with a general overview of a primitive pottery construction sequence. I have to credit Steve Watts with this nice organization of  
 notes on this sequence. Steve is a good friend of mine and an excellent primitive skills instructor. Extremely knowledgeable. I consider him my  
 mentor. The sequence below is referenced in a primitive, anthropological matrix but is still very relevant to producing pottery in a survival  
 situation. We are talking pottery for use as a cooking or eating vessel not as art. Pottery is great to cook in. It transfers heat very quickly to the  
 contents of the pot and even allows you build up flame around a pot to cook in. Normally, flames are not used to cook with, coals are, due to flames'  
 inconsistent temperature vs. coals consistent temperature. Cooking is another subject, but is definitely one we ought to cover sometime in the future.

----- PRIMITIVE POTTERY CONSTRUCTION SEQUENCE By Steve Watts (1989) 1.  
 OBTAIN CLAY (Creek or river bank, bottom, etc.) 2. PROCESS If fresh, remove large rocks and organics, add water, if needed, wedge, knead,  
 remove lumps. If dried, pound with mortar, reconstitute, let settle, let dry (if too wet), wedge, knead, remove lumps. 3. ADD TEMPER Sand, grit,  
 shell, grog (broken pottery), etc. 1/5-1/3, knead, wedge. 4. VESSEL CONSTRUCTION Moulding, modeling, slabbing, coiling, welding,  
 stretching/thinning, smoothing, malleting, etc. 5. SURFACE TREATMENTS Smoothing, stamping, burnishing, cord marking, brushing, cob  
 impressing, punctating, incising etc. 6. INTERIOR TREATMENTS Smoothing, burnishing. 7. DRYING 3-10 days, depending on conditions. 8. PRE-  
 FIRING 9. FIRING 10. USE Cooking, storage, transportation, burial, processing, eating, etc. ----- Benjamin Pressley

 benjamin@PERIGEE.NET MIME-Version: 1.0 To: Primitive-Skills-Group@uqac.quebec.ca Subject: Fish Poisons Content-Type: text/plain;  
 charset=us-ascii Content-Transfer-Encoding: 7bit Hello group! I e-mailed Christopher Nyerges at the School of Self Reliance in the City of Angels  
 and asked him to help us out on the scientific names of the fish poisons I gave out the other day. He not only supplied me with some of the names but  
 gave me some other info I thought I'd pass on. Here are portions of his note in quotes below and some additional info I have found out since then: "  
 Hi Benjamin. As to your plants poisons: A few I will need to look up. I would be happy to provide you with an article about poisons and how to use  
 them. White Camus Lily -- I have to look up, but I don't think we're dealing with anything rare here. In Calif. anyway, you're probably referring to  
 Death Camas, Zygadenus sps. Otherwise, you'd need to tell me range so I know what area of the country you've found this in. I am unfamiliar with  
 that common name. Devil's Shoestring: Again, this is a common name that I am not familiar with, and it could be a local common name. I suspect  
 you might be referring to Hedera helix, common English ivy, whose leaves and berries contain glycoside hederagenin, which could cause death. A  
 related plant-- probably in your neck of the woods, is Aralia spinosa, sometimes known as Devil's walkingstick, has berries that could kill if eaten in  
 quantities. Could you be referring to that? [As far as Devil's Shoestring I found out it is actually Tephrosia virginia, a perennial herb and legume  
 commonly used among the Catawba people to treat rheumatism. It is also known as Goat's Rue. It grows in NC and SC from the mountains to the  
 coast. The correct reference was found in Frank G. Speck's book, Catawba Medical and Curative Practices (1937). ---Benjamin] Horse Chestnut  
 and Buckeye are both the same thing: Buckeye, the Ohio state tree, and there is also a California buckeye. The genus is Aesculus, referring to the  
 glycoside esculin. Its a good fish stupefier, and the nuts can actually be leached like acorns. I have done so. However, esculin is not noticeable like  
 tannin (bitter), so it's difficult to know when the leaching is done. Most folks just leave it alone. Polk Sallet: It's a poisonous plant alright, but  
 everyone from before slavery days ate it. The poison -- I don't seem to have its exact name at my fingertips -- is water soluble meaning you cook the  
 greens, pour off the water, and cook again and then you can safely eat it. We're speaking of ordinary Pokeweed (Phytolacca americana and related  
 sps.). Some folks see the word Sallet and they think it means Salad. Wrong! Sallet is, if my memory is right here, from an Old English word and it  
 refers to cooked greens. Anyway, death can occur if you try to eat this and don't do it right. Turkey mullein is restricted to the Southwest, I believe. I  
 don't have the Latin name handy, but it is in the spurge family, and it grows in low, mounds. The leaves resemble mullein leaves, but are toxic. I have  
 used it, thrown in pools, to stun fish. Wild Cucumber is also known as Manroot, and it is the Marah genus. There is a chapter on this in my Wild  
 Food book. Do you have a copy of the book? If not, I'll send you one. Though my book doesn't say this, you can mash the root and throw into pools  
 to stun fish. I have not done this. I hope this helps. Christopher Nyerges nyerges@earthlink.net <http://home.earthlink.net/~nyerges/> Expect ONLY  
 the very best and also Prepare for the very worst" ----- Thanks to Christopher for the help. He does have  
 some excellent books on plants and a workbook on survival skills. Just check out his homepage for details. There are also some nice links there. And

if you're in his neighborhood he conducts some fine classes. I've been twisting his arm to get him to join us. He would be great to have for his plant knowledge alone. He is also skilled in many other ways. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. He is a very skilled survival and wilderness living skills instructor. He wrote the following excellent article on the subject of making strings for bow and drill firemaking sets. I think you all will find it extremely informative. Also if anyone is in the NY area, check out his excellent classes. Information on contacting him follows his article. -----

----- FAST, SURVIVAL BOW DRILL STRINGS Why Spend Time Fiddling With Your Bow? By Barry Keegan =A9Barry Keegan 1996 WHY BOW DRILL? The hand drill fire is the fastest means of making fire: if you must start from scratch. I found this to be true in arid environments or seasons of drought. New York State is far from being arid! After years of practicing the hand drill fire I have reached MY physical limitations. I was finally able to make hand drill fires with a spindle and fire board of very dry Mockernut Hickory (our most dense native wood) but I still couldn't make fire with a damp Mullein stalk spindle on a willow fire board. Using a bow drill to make fire is more reliable than a hand drill. Because of this climate, damp wood may be all that I have to work with. The problem, though, is finding a good bow drill string that won't take long to make or find! This was a lot of work and lead me to rediscover what can be used. WHY PLANTS? I limited my self to plant fibers because in a survival situation I can't always rely on animal products to be available for cordage material. For clarity=92s sake I will rank these bow drill strings in categories beginning with the most year-round available cordage and ending with the most specialized and seasonal ones. Tree bark, branch bark and root bark, roots, wood, stalk fibers, leaf fibers, vines and runners. TREE BARKS I will begin with tree barks because they are available when the ground is covered by even the deepest of snow. Tree barks also happen to make some of the strongest cords and most of the good ones can be peeled at any time of year. I list tree barks in two categories: Branch barks and Root barks, because each behaves differently and are often handled differently. Branch Barks "Branch Barks" is the category of bark that comes from any part of the tree that is not a root. However, certain parts of the tree provide far stronger bark than others. Select a shoot or branch that is somewhat straight, preferably with no branches, scars, dead spots or any such flaws that interrupt the bark fibers. The branch should be about three feet long and at least thumb thickness to obtain enough bark for a cord. Avoid very tapered branches. Do pick a healthy branch, dying trees have dying bark and work about as good as they look. Knot holes in bark strings may cause separations that tear out during use. What kind of tree you use is of major importance. The strongest bow drill string of tree bark fiber in New York also happens to be one of the easiest to make. Mockernut and Pignut Hickory work better than other hickories and are my favorite choices! Peeling Bark As a general rule, May 1 through August 1 is peeling season: the time of year that bark peels easiest from trees! This is not a long season but farther south it may be longer. The Basswood tree has its own season which starts earlier and ends later than others. Basswood is the easiest to peel at any time of year. There are three methods that I know of to remove bark at any time of year. None of these methods are necessary during peeling season unless you have an unusually difficult branch. To obtain bark out of "peeling season", you may use pounding, split-separation or if we weren't trying to make a fire, we could use the fire to carefully roast or steam the bark off. I will begin by discussing the easiest of these methods and end with the most difficult. I will not discuss the roasting method for obvious reasons. Peeling In Season Cut or abrade off your branch of choice and remove any twigs or branchlets, if you have them. On the cut end try to peel the bark free, as if to begin peeling a banana. If it easily separates, and it should, examine the branch for knot holes or areas of removed twigs. You may want to use a sharp stone flake or knife to score the entire length of the branch to make two or three bark strips of even width and as little taper as possible. This is the best way if you did have branchlets on your branch because you can make the cuts align with the branch scars. Holes in your bark strips are less of a problem if they are on the edge of the strip instead of the center. Careful peeling can produce good results without scoring if you peel both or all three sides at the same time. You need at least two feet of cord from this branch so go slowly and carefully. Watch for sticky spots! Knots can be very sticky. Pull the bark strip at a 35 degree angle or less from its branch to minimize the tapering tear. Pulling straight up (90 degrees) or back on itself (180 degrees) will drastically increase the taper or tear out. Sometimes rocking the strip back and forth as you pull on it can free up the bark at a sticky knot area. If it still sticks, consult the pounding section of this article for another way. Once in a while I find a branch that won't peel, even in peeling season! Trees can be as different as people are, so, if this happens, find another tree or at least a healthier branch. Peel your bark right away or store the branch completely under water until peeled. Elm bark may not peel the next day after it has been cut. Hickory may not peel after being cut three days before and is noted to stick in times of draught, especially on high hills. On the contrary, Basswood may still peel a month after being cut if it sat in a damp shady place. As a general rule, the youngest branch or shoot that grew the longest length in the shortest amount of time produces the best bark! Some trees like Aspens will give strong bark only on its one year old growth. Good luck finding long straight Aspen twigs that are big enough to provide enough bark to make a sturdy bow drill string. I had to peel 25 ordinary sized twigs to make mine! If a branch broke off about two years ago and a bunch of sprouts grew from that wound, there may be enough bark on one of these sprouts to make six bow drill strings. Arrow and basket makers purposely cut back Willows and other plants to force them to grow more suitable shoots for materials. This is called copusing! The deer or a storm may have done some copusing for you. If you know your trees well, i.e. Willows grow by water and deer go there a lot, you may find some choice sprouts growing from a broken "buck-rubbed" branch. Beaver love to eat Aspen! Pounding Bark "Out of Season" If the bark doesn't peel from your branch, find a smooth stone or smooth the bark off of a dead log, this will be your anvil. Then find a sturdy branch of wrist diameter for your pounding mallet. Break it to a one foot length. Scrape your anvil and mallet smooth of any protrusions that may injure the bark that you pound. Lay the branch across the anvil and begin pounding at the thick end of your branch. Pound till the bark separates on all sides. You need to strike hard, but not so hard that the bark gets crushed. Work down about six inches of the branch's length, pounding every inch or so on at least two of its sides. The bark does separate from the mallet side as well as the anvil side of each blow, if the strike is well centered. Once you get the feel for how much or little pounding is needed, you can pound the whole branch and then peel it, of course, going slowly to watch for sticky spots. Pound where it sticks till it pulls free easily. If you pull the bark hard past where it sticks you may leave the strongest part of your cord stuck to the branch as the bark tears out thinner. If it is close to peeling season and the bark sticks, you may score the bark before pounding. Little pounding is needed at this time to remove the bark. In mid winter you will have to pound the bark so hard that it will split where it wants and you will have to choose from what you are left with. At times you may have to pound so hard that the branch becomes

splinters! Hickory bark is very tough and can take a lot more beating than other "cordage grade" tree barks. Hickory and Basswood are the easiest branch barks to remove by pounding because they don't crush easily under the mallet. Gentle mallet work can help remove the bark from Pawpaw, Elm (Slippery and American), Tulip Poplar and Willow. These barks are more delicate! Try working with one to three inch diameter branches because the bark is thicker on bigger growth and can withstand more mallet work. However, pounding becomes ineffective on branches that are more than three inches thick. You should have no problem obtaining at least one, hopefully two or three, full length bark strips from your branch. Even if the worst happens and your bark as well as your branch are in splinters, save those splinters and keep reading, you can still make a string! Split - Separation In or Out of "Peeling Season" Once you have learned the split-separation peeling method you may never pound bark again! Now you can peel bark (if you haven't already). This method of peeling may require a lot more practice than pounding but you will be able to peel bark from nearly all of the cordage grade trees at any time of year! Take your thumb-thick branch from a tree or bush by abrading half way through its top side. Then pull down on the branch so it splits and make the split run about two inches down the desired end of the branch. Then abrade the branch off. You need to split the whole branch in half. Any split-shoot basketry book or article will show you how to do this, but, basically you need to pull with equal pressure and angles on both halves of the split to guide the split down the stick. If one side becomes thicker, pull it at an increased angle to steer the split back to center. This is a faster way to make two equal sized strips without using a stone flake to score the branch. A branch that is thicker than a thumb may be split in three by splitting and pulling on all three splits at once or also split into four by halving the halves. Remove bark by snapping the split stick near the center very slowly by bending it in both hands, pressing your thumbs on the bark side and bending away so it breaks down to the bark, revealing it. Next bend the break at a 35 degree angle so the wood that clings to the bark peels away from the bark. Then, if you're a righty, hold the branch at the crack, in your left hand so it lays along your left arm down to your elbow and with your right hand, lift and pull away the wood from the bark. You want the bark to stay flat and taut. Just as if guiding a split, you need to pull on the wood part of the branch so it does all of the bending because it is much thicker than the bark. This should look like a backwards, small letter "y". If the branch cracks or breaks off, peel up the next section as you did the last, from where it broke off. Keep peeling it like this until all of the wood is removed from that half of the stick. Then flip the branch around so you are holding the peeled bark in your left hand and the stick part lays along your left arm, as before, and remove the rest of the wood from the bark. With practice this can be done in two or three minutes. You may lose some bark to splintering on its outer edges. This is less likely to happen if you split the branch into thirds or fourths because the flatter the bark lays on its branch, the easier it is to pull free. Imagine peeling masking tape from a wall compared to peeling it from a pencil which has been covered with a length-wise strip of tape and the edges wrap all of the way around. Remove the splinters from your bark strips by pulling the bark splinter at a 180 degree angle (back over onto itself). This causes it to intentionally tear out without tearing far at all. Woods that are flexible, like Willows (especially shrubs), will allow you to split a branch in half, third or fourth down along its growth ring(s) so the wood part of the branch is about as thick as the bark is. This makes it easier to separate the bark without breaking the wood part as much. Butternut or White Walnut are too fragile to be pounded but may give strong cordage when peeled in this manner. Even in January it provides a strip whose strength compares to some Hickories. Do remove the outer bark when using Butternut, Mulberry, Osage Orange, Aspen or any bark that won't twist without cracking the outer bark. Outer bark may be removed by scraping with a stone flake or by abrading it off on a gritty rock, but the fastest method leaves you with the strongest results: split-separation! Split the outer bark from the inner bark at one end by using a sharp edge or bend the bark so the outer part snaps away from you. Then peel up a section and split it in half as you would split a branch, by pulling with equal tension and angles on both halves. Root Bark I will discuss how to dig, find and select roots for cordage later in this article. How many branches are on your root is not as important for root bark as it is for root wood or branch bark strings. Hickory root bark is the strongest of the root barks. It is as strong, if not stronger, than its branch bark and is easier to remove. Hickory, Walnut, Osage Orange, Red Cedar and some of the Elms and Cherries have root bark that is much stronger than the wood part of their roots. With Mulberry, Black Locust, Willow, American Elm and Hemlock, their root barks and root-wood fibers can be equally as strong. I have found some variations of strength within species and environments. With the exception of Hickory, the root barks listed above share a unique characteristic unlike any other local plant fiber cordages: elasticity! A root bark bow drill string can stretch up to two inches when pulled tight. Because of its elasticity bow drill strings of root bark do not need to be as thick as those of branch bark. A thumb-thick root is overkill and a pinky-thick root is ideal. For an example of extreme strength I made a fire with a Hemlock tree's root bark string, taken from a root which was half as thick as a pencil. The string itself was as wide as a strand of spaghetti. To remove root bark, first cut your root and remove its smaller branches. Hang the root over a branch and hold it by both ends as if you were using it to saw the branch. A branch with toothy bark is ideal but do remove any sharp protrusions that may cut the root or its bark. Buff through the root bark on one side by pulling the root in a back and forth sawing motion. As soon as you've exposed the wood core down the whole root's length, pry the inner root gently out of its bark sheath. =20 Peel the bark from the root at the same 35 degree angle that you would to remove tree bark. Root bark peels easiest in bark peeling season. It peels almost as easily when out of season! You do not need to pound roots to remove their bark. Split-separation does work on roots but it's not necessary. Walnut is one of the few root barks that needs to be separated from its brittle outer bark. Most of the root barks listed here may be used "as is" for bow drill strings. Root bark is a better choice than branch bark when it's available. ----- Barry Keegan and his partner Anthony Follari operate a school in Elmsford, NY called PATHWAYS that teaches a variety of primitive, survival and wilderness living skills. EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32C0EAB0.33BE@saglac.qc.ca> Date: Wed, 25 Dec 1996 08:49:52 +0000 From: Dr AF Bourbeau Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, bourbeau@saglac.qc.ca MIME-Version: 1.0 To: Primitive Skills Group Subject: Poaching and environmental concerns Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable To follow up with Greg's worry about the fish bombing thread, I would like to address the issue of environmental ethics which has also been aired by a couple of others since that subject has been discussed. Please note that one of the purposes of this group is to conduct research on wilderness survival techniques, and obviously any of the primitive techniques relative to the taking of animals are highly illegal and often ecologically disastrous. We all know this! At the same time, it is these very techniques that are some of the most important to know in case of natural disasters or real survival situations where you must obtain food to survive. These subjects also have historical significance, and as such merit to be studied. I say that knowledge of any of these techniques does not at all mean that people are going to use them. After reading some of the torture stories of the Iroquois prisoners, one does not go out and try them on their neighbors. I have no intention of going to blow up fish just because I now know how. However, Alcan aluminium has horrible lakes of toxic wastes which are all red in color a few miles south of Chicoutimi, where they have been dropping their mess for the last dozens of years. I just might obtain permission and go and try a few bombs there! Another example: I learnt lockpicking many years ago and could now walk into most peoples homes just as fast as if I had their key. That doesn't mean I'm going to go and steal TV sets over the weekend! But how many times has that knowledge saved me and others who had misplaced keys... Here in Quebec a bunch of 90 poachers were apprehended this last fall. They were taking moose illegally with all kinds of ingenious traps and snares of their own design. These guys obtain their information from various places, but mostly from their own underground sources. Knowledge of their ways will not turn an honest citizen to a poacher. But it may give you food in an emergency. My point is that bad guys will be bad guys, and will get their info somehow no matter what. No amount of knowledge of bad ways will turn a good guy bad. The purpose of our group is not to feed info to bad guys. We are all here because of our desire for learning and sharing primitive skills, and some of these skills are definitely out of line for realistic use outside an emergency. That doesn't mean we should not discuss them here. Last month I caught 7 mice at the cottage with a figure 4 deadfall made from 3 pieces of firewood and a cookbook. Nobody's going to beat me up for doing that, and it helps me learn details of trapping. There are always honest ways to practice primitive skills. All this to say that I think that poaching ways and fish bombing can be discussed freely in this group. To me these should not be taboo subjects. As long as subjects concerning the taking of animals continue to be treated in the same respectful way it has been thusfar (information regarding techniques), I do not have any problem whatsoever. At the same time, I agree wholeheartedly with the essence of Greg's concerns. I too would be concerned with statements of joy and pleasure regarding bunny bashing and blowing fish guts to smithereens. I don't think any of us here are stupid enough to crawl that low, and I'm sure that if ever anyone would try that kind of behavior, they would be strongly reprimanded by the rest of the group. Thank you everyone for reading this and feel free to respond if you wish. Just trying the best I can to provide a possible orientation on this difficult topic. Sincerely, Andr Fran

I've learned (here in the U.S.) that Edwards publishing company had filed for bankruptcy and that the excellent series was out of print and unavailable. I can get a copy Edward's "More Bush Leathercraft" through David Morgan a U.S. whipmaker but not the earlier book "Bush Leathercraft" or any of the series books. Myself, I'm looking for the particular volumes dealing with leather braiding and whipmaking. Would you mind giving out your books publication data (year published, ISBN number, publisher - anything that'll help me search through the used booksellers on the net). Also, I've heard a rumour that Ron Edwards publisher had possibly reorganized and may be publishing the series again in Australia. Heard anything on this and anyway of checking with a source at your end? I know 4 or 5 people here in North America that would like to order, not to mention David Morgan's company. Thanks much, Chris

EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32C0C869.6709@rand.nidlink.com> Date: Tue, 24 Dec 1996 23:23:37 -0700 From: Chris Smith Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, chriss@RAND.NIDLINK.COM MIME-Version: 1.0 To: Primitive Skills Group Subject: Re: Blowguns Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable Re-sending for Andr Fran A short passage on Amazon blowgun construction from a travel diary-like book by a college professor from Ohio ("Don't Drink The Water," by Ida May Sonntag - 1980). She details her experiences during vacations and sabbatical leaves: "The people along the river are largely of Indian descent. I was able to barter for a Zarabatana (blowgun) with a member of the Maku tribe. This weapon is a simple yet precise hunting instrument. Only small game is hunted and contrary to popular belief is not used for warfare. The shaft is made of pachuiba (palmwood) while the mouthpiece is made of Brazilwood attached with a tree resin. Dart cases are made of woven palm strips and the darts are made of palmwood with wild kapok cotton stabilizers. With practice the Indians can hit small birds at 100 ft." Note: The site, about 11 mi. from the Amazon, along the Rio Negro river, near Manaus, Brazil. From the books cover jacket photo: Three Indians wearing long red-orange and yellow feathered headdresses. A man and boy shoot at some target with their blowguns, while a second man sits with his blowgun over his shoulder, watching them and the photographer. The blowguns are blackened, of large caliber and appear to be approx. 6-7 feet in length. Each has a cylindrical woven dart case, appearing much like an archers quiver and hung around each's neck by a tripled section of medium weight cordage. The dart cases hang down in front to their waists. The darts are approx. 18-24 inches in length and are about as thick as pencils. The darts extend above the top of their cases about half their length exposed. Each appear to have about 10 or 12 darts. They are gathered in a rain forest village in a forest clearing with a thatched open air long-hut (with hammocks hung inside) behind them, next to a stand of banana trees. ----- Chris Smith -----

<32BF3C50.4FBF@rand.nidlink.com> Content-Type: text/plain; charset=us-ascii Content-Transfer-Encoding: 7bit > Welcome Russ, >> I'm sure I'll ask you questions from time to time. Sounds like you > work for an oil company, right? In your work have you found any Native > American artifacts, like knapped lithic projectile points, pottery > shards, mummy's and the like? Any evidence of weaving or braiding > discovered in your excavations? What tribes and cultures have you > encountered in your 'time-travels' as an archeologist? How's that for > a start . Hi Chris and everyone else, I actually work for an environmental firm out of Austin, TX. We do biological as well as cultural resource management type stuff. Whenever a pipeline, a transmission line, well pad, coal mine, etc. are planned, we go out and survey the area for any archaeological sites. If we find any "significant" ones, we test them. If testing proves that they are more than just the run of the mill scatters, we often excavate them. So in answer to your second question, yes I've found all sorts of Native artifacts, its pretty much a daily occurrence when we're out in the field. I also work in the lab were I do whatever has to be done. My main job in the lab though is the illustration of the artifacts for publication. I'm an archaeologist and an ARTaeologist I guess you could say. We find lithics and pottery, but no mummies down here. We do have the occasional burial, but rarely. No signs of weaving since this area of Texas has acidic sandy soil that pretty much dissolves everything that is not rock. As for my "time travels" as an archaeologist, those hopefully lay ahead of me. I've been doing this for a while now, but only for about the past four years professionally (that is, getting paid for it). That is why I'm pursuing higher degrees, otherwise I'm relagated to being a hired shovel bum. I have run several projects, but technically I don't get the credit since the law requires a Master's degree to do so. Soon that will be taken care of. I did go to the Middle East for a while. You can find artifacts there all over the place (just walking down the road). I was chasing a herd of camels in the desert once and found an area where the wind had deflated some dunes. I found several flint cores, some pottery (that dated to around 200 B.C. from Syria), mussel shells from the ocean, and two hearths with burned bone in them. People have lived there for thousands of years so I guess it is no surprise that there are artifacts everywhere. I even found an old net weight made of stone washed up on the beach. That is about as extensive as my travels go (oh yeah, I hung out in Amsterdam for a while :] ). Otherwise, I've just travelled all over Texas digging sites. As for the tribes, that is hard to say. Most of the stuff is Archaic or Paleo so we have no idea who the tribes were that far back. Of course some of the upper layers have artifacts usually associated with the Karankawa, Cherokee, Apache, depending where you're at in the state. Other than that, I'm just the young hippie type trying to make a living by having a good time out in the woods looking for stuff. It's a pretty "groovy" job. Peace, Russ

Second, and I believe this applies to all >mass-killing methods, it does a great deal of harm to the ecosystem that >you use it in. What is the point of killing 1000 fish at once, having >half of them spoil, and then having none left for next spring or >whatever. Not to mention that none of these are really a primitive >skill :), but that's beside the point. >-- >----- There is only one good reason for large scale killing of any creature, and that is if you have the facilities for drying and placing into storage the fish for your community. They also did this if the animal population could bear it. It was considered inappropriate to kill on such a large scale for just one person. Remember a hunter in a primitive community didn't just hunt for himself. he hunted for his village and family as well. No one, went away hungry. It's funny isn't it that we call them primitive. JB

Biddle) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, kgb13@PTIALASKA.NET Subject: Re: Willow bark as aspirin (and an introduction) Heya all, First let me introduce myself a little. My name is Greg Biddle, I'm an archeologist, currently working in Juneau AK. I have worked all over quite a bit of the western and midwestern US. I have been flintknapping for about 7-8 years and have been interested in / practicing 'primitive' skills since my uncle taught me how to shoot a bow, bareback from a horse, and how to cure squirrel pelts with table salt (Sorry Mom!?) I am really enjoying this group, although I was getting a little worried about the 'fish bombing' thread!! Andre wrote: >I've used willow bark tea for aspirin on survival trips and it works, >but may irritate your stomach (no buffers like in store bought aspirin). >I would like more information on preparing this too. Is it really the >inner bark that works or all of the living parts? What strength does >the tea need to be to correspond to an accurate dosage? Is there a way >to remove the bitterness? Are there other ways to ingest it other than >tea? One way I've found to 'buffer' the willow bark is to add a little bit of mint (especially peppermint leaves) to the tea - it also makes it taste a LOT better. Mint also works as a stomach-soother by itself. And I have also used red willow bark with the same effects. As for dosages, I usually follow the 'intuitive' rule of about one cup of tea every 4 hours or so until the problem goes away. And I have heard that willow bark can be smoked to ingest the aspirin-like stuff, although I imagine that would just cause throat pain instead of stomach pain! And the bark can be chewed - same stomach and taste problems, but this does work especially well for toothaches (yeah, go figure!) Well, thanks for letting me put in my 2 cents - I'll be watching closely, as I think there is lots coming from this group for me to learn. Greg

I am Bob Jones of Charlotte, North Carolina, USA, and have been lurking since day-one. I came by way of the Knapper's list and am looking forward to learning more about the primitive skills discussed here. I am a beginning knapper. My interest in stone tools was born the day I stumbled upon my first arrowhead as a boy. My perception of the world changed as I lifted that point from the ground. To this day I continue to sense the historical presence of the many who came before me as I walk a trail or cross a field. I am awed by the many skills of those in the group. I come to the group with a deep interest in the topics and a desire to learn as much as I can. So far I have broken rocks, constructed bows and worked with leather. I am a camper and my wife and two children enjoy as many weekends in the Carolina mountains as we can manage. While there we visit museums, rock shops and historic sites. The area around Cade's Cove in the Smoky Mountain National Park has become our favorite place to visit. Like many here I am a veteran. Joined the Navy at 17 in 1963, travelled Europe (or at least its coast), returned to a job in the fledgling field of data processing, quit that to spend four years in college (broadcast journalism and motion picture production), pretended to be a hippy, returned to data processing (where the money was) and then pretended to be as ordinary as possible. Visitors to my home, however, find it unusual that a quiet office dweller would cover have his livingroom walls with bows, arrows, spears and other primitive artifacts. Living in Charlotte I am fortunate to be near Ben Pressley and the site of the annual TRIBE gathering. I have known of TRIBE for several years and have wanted to attend. We planned to do so this year but a conflict arose. But the family and I certainly will be there in 1997! Thank you, Andre', for creating the list and drawing the group together. I have learned much already and look forward every evening to reading new posts from the members. I wish each of you and your families a safe and happy holiday. Bob Jones Charlotte, NC writer@perigee.net

I usually make an infusion (a tea). For a mild sedative a bundle of young tiny branches steeped in boiling water is very soothing. You can further concentrate it by boiling the inner bark and branches, inner bark seems to be strongest. The more you boil down the stronger it becomes. You can also make a tincture by crushing and cutting up the inner bark, placing it in a bottle of ingestible grain alcohol, placing in a dark place and shaking it every now and then. The shelf life is much longer and it is more concentrated this way and usually only requires a couple of drops, wait and see if it helps and give yourself a couple of more drops as you need it. I have also just chewed the inner bark. It is very bitter, but somehow a satisfying sensation. It takes the edge off of minor pain like muscle soreness. An infusion can also be rubbed on the skin to soothe muscle soreness and can be gargled for throat soreness. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. From: jburdine@pipeline.com (James E. Burdine) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, jburdine@PIPELINE.COM Subject: Re: Fire with guns The main problem with springpiston airguns is that while being simple in operation they can be easily damaged by dieseling. That causes damage to the springs and the piston seal. Also it would take a very special tender to be small enough to pass down an airgun barrel and still hold together long enough to be found and then used for firestarting. I've tried the felt cleaning pellets without success, and trust me DO NOT SHOOT TOWARD YOUR HAND AND TRUST THAT ANY PAD WILL STOP THE FORCE OF, OR PENETRATION OF THE FELT PELLET. Forgive me for shouting, but benefit by one of my moments of supidity. Air rifles can be good, quiet foraging tools for small game, but if you rely on it for small game hunting don't risk it for fire making. You will be encouraging conditions that shorten the life of your tool. JB

Drying and smoking the 1000 fish might >save your life during the winter. > >Please take no offense to many of the issues which we discuss on this >group which are unacceptable in real life. We are just trying to learn. >Some survival techniques we can only discuss and never try. > I do agree with the above comments. I originated the explosives issue, but I do not promote it. I was just comparing this method to fishing with oxygen inhibitors. I'm not proud of everything I ever did. I was a teenager when I did these things and I didn't do it very often. I was more repulsed by watching the indians poison streams. I prefer to fish with rod & reel. I was a great skin diver as well. Although I used a rubber powered spear gun, I never used SCUBA gear. I would dive over 100 feet down and shoot fish up to 200 pounds and then drag them to the surface. I learned to hold my breath for 2-3 minutes and special free diving techniques by reading the book "The Pearl Lagoon" That was a story about 2 California youths who traveled to Polynesia with their Uncle. They learned to dive using instructions from Pearl divers. The instructions in the book were in fine detail and they worked. In three months, I went from holding my breath for 30 seconds and diving 20 feet to holding my breath for 90 seconds and diving 60 feet. Over the next several years, I extended that significantly with practice. There is a whole new world under the sea and a great place to gather food and useful materials. Are there any other divers in this group? Ted Bailey || email to: tbailey@ic.net P. O. Hey, even I can come up with scientific names thanks to >Chris's great reference to the Ethnobotany Cafe! That is very possible though the guy who told me about using mullein was discussing the mullein that grows around here (Maine) when he talked about it. He said you just crush up some seeds and throw 'em in. I am trying an experiment with leaves as its darn hard to find mullein seeds this time of year. Leaves don't seem to work. I have a few seeds and may try them. The guy also said the seeds only stun the fish. They are paralyzed for a while. He cautioned that if I were to try it I should not do it on a sunny day or all the fish would die of exposure as they floated to the surface. Jeff -- "But Maine, perhaps, will soon be where Massachusetts is. A good part of her territory is already bare and commonplace as much of our neighborhood, and her villages generally are not so well shaded as ours." -Thoreau email: jstevens@ccs.neu.edu home page:

 straight, dry shoots or do you collect green >ones and dry them? I didn't know it was Ishi's favorite, but now I'm even more excited about buckeye. :-  
 ) I have yet to collect any mullein, so I can't compare them. I've seen mullein down around Santa Barbara, but not up here in the SF Bay Area. I  
 suspect it's out there; I just haven't noticed it. I've only been into primitive skills since last May. Buckeye is a tree, by the way, not a little plant like  
 mullein. Did Ishi use very young saplings, or branches? I suppose it would have been easy to collect the seeds and grow saplings especially for this  
 use?? I collected all the buckeye I've ever used from a single tree situated between a creek and a road. It suffered winter storm damage and I cut  
 some logs from a large-diameter downed branch. I then cut the logs into spindles and fireboards, and have quite a large stockpile. I've also used  
 alder since it's a common wood, but alder's tougher to get a coal with. The buckeye that I have is great -- the coals come quick and fat and long-  
 lasting. --John

 do you come up with all these >references I have never seen?! :-)>I've just been interested in the same subjects for quite some time. I've been looking  
 for the old knowledge for some time. :-) SURVIVAL POACHING is by Ragnar Benson and was published in 1980 by Paladin Press 303-443-7250  
 CaO is quick lime and can cause horrible caustic burns if spilled on wet flesh and not cleaned up immediatly. When CaO is combined with water it  
 reacts and becomes Ca(OH)4 or calcium hydroxide. When mixed with water it expands about three times in volume and gives off a great deal of  
 heat. "Collect a number of clean onr gallon glass jugs. These must be glass and similar to those used for vinegar, wine or apple cider with a small  
 neck and secure cap.Clean the jugs thouroughly and then dry them out till they are absolutely bone dry. No moisture can remain in the jug. You  
 must have about five pounds of clean pea gravel for each jug. Five pounds is about two #6 peacans full. dry this gravel over a low fire, and then pour  
 it luke warm into the gallon jugs. There should be a good healthy inch of gravel in the bottom of the jug. At first it is advisable to test the gravel to  
 see if it is heavy enough to sink the jug. Cork the glass up tightly and float it in a barrel or tub. There must be enough gravel in the jug to sink it  
 without hesitaiton. Having done this, dry the jug again and carefully pour in one #6 peacan full of CaO in each of the prepared jugs. Replace the cap  
 making sure the jug is sealed airtight. The explosive jug can now be stored safly until used. I usually take two or three of the jugs with me in the  
 boat. They will arouse no suspicion until used. To prepare a jug for use,uncork it and hold its mouth just below the surface of the water. Allow about  
 one quart of water to pour in cap the jug quickly and let it sink to the bottom. Properly done, the jug will go off with a very nice blast in about one  
 minute. The blst will kill fish just about on par with a one stick dynamite charge. Quickly collect the fish as they float to the top with a spear or net. I  
 don't believe it is advisable to use these lime bombs in less than five feet of water." There is a bit more mostly that the lime bombs will work at great  
 depths where dynamite won't. I like Ragnar Benson's other book LIVE OFF THE LAND IN THE CITY AND COUNTRY 1982 also published by  
 Paladin press. Touch of the Bear JB

 Status: U X-Mozilla-Status: 0011 Andre; I didn't post it to the group, mainly because I wasn't sure it was appropriate on a primitive skills group,  
 even though people barely out of the stone age are using it in SE asia. Also, even though I think most people are honest, and the information is  
 available in print, why should I make it any easier for people that want to break the law ,to do so? Most of the primitive skills limit the chances of  
 taking game on a level that is nearly equal for the game in question. Modern guns, explosives, and techniques require very little knowledge on the

part of the user to take game and if broken require specialized knowledge to repair or replace. Primitive tools, on the other hand require more knowledge both of the materials themselves and the game they are to take. Generally they are quieter as well. Not that mass destruction was not practiced by our ancestors. Game drives either into a fenced off killing area or over a cliff was known to have been practiced nearly everywhere in the world in ancient times. The difference is that every part of the animal was used in the hunters community, surplus was dried and stored, and shared with other villages of the same people. I apologise for preaching. To answer your other question. Calcium carbonate CaCO<sub>3</sub> is limestone same as simple lime you might add to your garden. Common limestone is heated to produce quick lime. or unslacked lime CaO. Once water is added to that it is slaked lime or calcium hydroxide Ca(OH)<sub>2</sub>. Quick lime is hard to find but not impossible, it is used in some capacity to clean outdoor toilets. I understand that it has been used by criminals to dispose of bodies. All of this info is from Ragnar Benson's book SURVIVAL POACHING. Biological poisons are the primitive man's form of explosive. A fish trap or tidal pool with small amount of effective toxin that stuns the fish makes sense for a community or even a single person that will dry and smoke the surplus. For more info on preserving fish in primitive methods among other arts see SURVIVAL ARTS OF THE PRIMITIVE PAIUTES by Margaret M. Wheat University of Nevada prss; Reno, Nevada 1967 ISBN 0-87417-048-6 It's a paperback approx. 11x14inches and ran about \$10 (U.S.) when I bought it. If you want to post the excerpt from Ragnar Benson's book along with this post to the group be my guest. I just wasn't sure it was appropriate. JB

Burdine) Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, jburdine@PIPELINE.COM Subject: Swim fishing Hi Ted; I've heard about that sort of thing, and also heard of guys that still do dive in the old fashion going to great depths by holding onto a stone ballast until they get to the depth they want then letting go of the stone. That reminds me of another subject in a wierd sort of way that says more about the way my mind works than I'd like to admit. In THE LAST WHOLE EARTH CATALOG a guy by the name of Ben Masselink had a letter published on hand line fishing and a new twist he put on it he called swim fishing. He was using a Dos Equis reel(an empty Dos Equis beer bottle with fishing line on it) and a white feather jig. It was a hot day so he started swimming and dancing that jig along the bottom of the beach and started catching fish. Apparently he uses fins, mask and snorkel and is able to see the effect of the lure and where to put same in his words " The beauty of swim fishing is that you swim the water the boats can't work. You also work ten times the water that a surf fisherman can because you present the lure parallel to the shore, fishing it all the way." He also comments at the beginning of his article " As you know, spin fishing (where the fishing line pays off the face of the reel) is a very old way of fishing. Even before the invention of the bottle or can, Indians fished in the spin off style using a kind of spin off shuttle. People throughout the world spin fish off bottles and cans." He recomends an Australian plastic reel that I've seen sold in the Into the Wind Kite catalog. My own experience with hand line fishing has been much tamer and without emersion. I've fished for trout, crabs, and crayfish at various times of my life. The biggest fish I've caught was a 15lb. carp with a length of line and a piece of corn(and released it) Touch of the Bear JB

As a college student I am very excited that it is Christmas break and am spending as much time as I can working on skills. Amongst other things I have been working on bows. Yesterday I made a small eighteen incher that broke while I was tillering. Today I made another eighteen incher that broke while I was shooting my cousin (serves me right). I also made a bow about two feet long. Works real well. I have been shooting pillows with the blunt arrow I made out of a sliver of maple and it is good to about thirty feet. I was wondering, does anyone have any experience with making a bow from store bought wood? The small bow I was shooting my cousin with was made of a cedar fence post. Seemed to work well. It looked like the outside was all one growth ring but it was hard to tell. Anybody ever just gone to the saw mill and bought a four foot length of cedar to make a bow? Thank you and I really enjoy this list. Anybody know the request address for the thrower list? Jeff -- "But Maine, perhaps, will soon be where Massachusetts is. A good part of her territory is already bare and commonplace as much of our neighborhood, and her villages generally are not so well shaded as ours." -Thoreau email: jstevens@ccs.neu.edu home page: <http://ccs.neu.edu/home/jstevens> --

Anybody know the request addre= ss > for the thrower list? Hi Jeff, Thanks for starting a discussion on bows. Again, I would suggest that=20 you break down this immense topic into several smaller, more specific=20 parts, such as wood choice, tillering, etc. As far as your lumber question is concerned, I think you would have poor=20 luck because you want to make a bow with the part of the wood next to=20 the bark. This part is always removed to square off the wood before=20 sawing and going to the lumberyard. A small sawmill, however, might be able to cut you some wood including=20 the outer part. To join the thrower list (I love this list too), look here: <http://ic.net/~tbailey/Primitive.html> This is Ted Bailey's primitive technology page which includes how to=20 join the thrower group (and has other great links and other lists too). Have a nice day. Andr=E9=20 -->20 -----

bourbeau@saglac.qc.ca > ----- I agree, The same tools that can heal can also kill. Other than eliminating pests it is a responsible practice when, for example, testing trap triggers on our field trips that any animal life taken should be with the intention to eat or for bait, even in practice. I have taught my children this as have others who have children that they teach how to use blowgun or bow & arrow. If they take life it had to be eaten (unless it was diseased, of course.). You can't get fanatical about this, perhaps, but, even a tree should not be chopped on unless you have a purpose in taking it. For example, taking bark from a tree for a basket or cordage, kills the tree, you might as well plan some uses for the rest of the tree also, even if it is only for firewood. We are to be good stewards with our resources as well as the skills that have been trusted to us. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. Box 20015 Charlotte, NC 28202 USA E-Mail: tribe@perigee.net TRIBE does workshops, networks, does an annual event called TRIBE Gathering and a quarterly newsletter. TRIBE Gathering is scheduled for June 12-15, 1997 in Charlotte, NC. Over 25 instructors from all over, camping, hands-on learning for anyone interested in primitive, survival and wilderness living skills. Check out our home page for more information. MANY INTRODUCTIONS Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable Hello everyone, I am posting this file for all of our new members who have not seen many=20 of the original introductions. Unless someone objects, I will do this=20 everytime a couple dozen new members sign up. We currently have over 80=20 members, by the way, which is incredible for a list that just started up=20 a couple of weeks ago. I take this opportunity to welcome all new members and to thank everyone=20 for the great posts! Also, thank you everyone for renaming subject=20 headers so that they match message contents. I will be posting the=20 december archives in early January. Andr=E9 ----- PRIMITIVE SKILLS GROUP--

INTRODUCTIONS This is a list of the introductions sent to the primitive skills group=20 by some of the members. The introductions are listed in the order in which they were received. This file can help you feel at home by=20 learning about some of the people which make up the group. If you=20 would like your name added to this list (or removed) or if you would like to change the content, just let me know. Andr=E9-Fran=E7ois Bourbeau List manager bourbeau@saglac.qc.ca ----- Andr=E9-Fran=E7ois Bourbeau

Hi everyone, my name is Andr=E9-Fran=E7ois Bourbeau and I'm a professor a= t the University of Qu=E9bec, Chicoutimi campus, where I teach outdoor pursuits in an adventure tourism bachelor's degree. This 3 year program is in french, so unfortunately much of the material I have developped will have to be translated before it is useful to many of you- sorry about that. I have been at the university for 15 years now, teaching courses such as winter camping, whitewater canoeing, wilderness survival, outdoor leadership, environmental awareness, philosophy of outdoor education and such. I also have research duties, and my field of interest is "coureur de bois" and wilderness survival. I did my doctoral thesis on how to write clear instructions for primitive wilderness survival techniques. Since then, my research methods have been largely experiential: basically, I put myself in simulated situations in order to learn about old ways and develop new knowledge. I conducted two major trips, one was a 31 day experiment in 1984 where I was dropped by helicopter on the 50th parallel without food, without fire, without tools, without shelter- just the light clothes on my back. That was a pretty rough trip, details of which are to be found in a book I wrote about the experience entitled "Survie au Gr=E9 de la Nature"- sorry, only available in french for now. The book is a day by day report on the trip, to which was added a scientific report on various subjects studied during the experiment. The other major trip I did was in 1988, a 40 day reconstruction of a trip along the fur trade route in the year 1838. All the materials used were authentic reproductions of the period's gear, including real birchbark canoes and even handsewn underwear. This trip is documented in a film by KEG productions of Toronto called "Man of the Wilderness" which has been translated into many languages and has been shown on many television networks around the world. My main interests are in developping wilderness survival techniques for someone lost or downed in the boreal type forest. All ideas I find from other parts of the world I try to adapt to materials found here. For example, fire saws are possible with bamboo- I try to find materials to make it work here (haven't found any yet). I am really looking forward to all the fine discussions I am certain will develop as the Primitive Skills Group grows. By the way, I am the list manager for the group, so any concerns you may have about the way the group functions can be addressed directly to me. Finally, please note that I love hamburgers and french fries, but no ketchup. Thank you, Andr=E9-Fran=E7ois Bourbeau bourbeau@saglac.qc.ca ----- Benjamin

Pressley My name is Benjamin Pressley. I teach primitive, survival and wilderness living skills. I write for several magazines like American Survival Guide, Backwoodsman and Wilderness Way.=20 I co-founded an organization called TRIBE that now has members in 46 states, Canada, New Guinea and Guam.I publish a newsletter for TRIBE also that many of you will find interesting, I'm sure. We are a network that operates non-profit to connect people interested in primitive skills with resources and other people. I am skilled in many areas of primitive skills. Shelter building, fire making, water sources, some edible and medicinal plant knowledge (enough to get by), tools from stone, shell, bone and wood, braintanning animal hides, traps and snares, fishing technologies, cordage making, lighting methods, cooking without aid of modern utensils, and much more. Hunting Weaponry is particularly an interest of mine. I teach classes year-round and do a lot of demonstrations for schools, museums, etc. The particular weapons that my research has been in are slings, bolas, atlats, non-returning throwing sticks, blow guns. I will be glad to help out anyway I can with questions, etc.If you are interested in primitive, survival and wilderness living skills that I have please inquire. My skills are based on skills used by primitive people for thousands (more?) of years. If you want more information about our organization, TRIBE, check out: <http://users.aol.com/tbprim1/Tribe.html> Ted Bailey does this homepage for me. As I get more Internet/Web page savvy I plan on putting out a mini-

newsletter for people interested. For now, check out that site and it will tell you more about what we have to offer. Well, enough for now. I'm looking forward to interacting with everyone in the Primitive Skills Group list. My thanks to Andre for getting it set up. ---Benjamin (benjamin@perigee.net or tribe@perigee.net) ----- Matthew Rapaport Hello... Thank you to Andre for inviting me to participate. I am a classical arm-chair primitive! I enjoy a good camping adventure, and=20 have had a fair number in my youth, but none for a decade or more now. Even these were not primitive living the likes of which our host has experienced, but rather late 20th century American style back-packing which means NOT that you use what is around you to make your way, but that you touch as little as possible! The object as much as possible is to leave the environment as untouched as possible while you pass through it. I am not a hunter, though I have fished (mostly in salt water). I know=20 how to prepare fish and other sea food, but would like to learn to dress=20 game, even if I don't kill it. I do enjoy shooting with fire arms, and bows however, and could hunt if I had to do it, even with a slingshot. Better=20 I round myself out gaining some experience with traps! My real interest in bushcraft skills for now is not in wilderness=20 living, but in living more or less comfortably though a period of normal infrastructure and service disruption in my semi-urban environment, typically as a result of some natural disaster like an earthquake! Here what is important is having stocked the right materials in the right quantities in places that survive the initial disaster. If the supermarkets are closed long enough, I may want to fall back on some=20 food finding skills for a while... I look forward to future conversations. matthew rapaport Philosopher/Programmer at large KD6KVH mjrcrl.com In God we trust. All others we monitor! quine@dfw.net -----

----- Mark Bradner Hello group... I live in the Seattle, area, I've spent a large percentage of my 45=20 years backpacking and camping in the Pacific North West. So I guess primitive technologies have always interested me. This year I have taken up flintknapping, and I heard about your group from the knapper list=20 server. Mark Bradner ----- Chris Smith Hello Skills Group, =20 A very big pleasure and opportunity to learn from and share with you all. These introductory things are always very painful for me, so I hope you don't mind me torturing myself a bit. My name's Chris Smith, I'm 48 and live in Coeur d'Alene (Core duh'Lane), Idaho, USA. That's near Canada and is a place of big lakes, rivers and forest woodland. I'm pretty happy, even when shoveling snow. I'd rather be in a hot spring than any other place on earth and that's why I live in Idaho. I still work irregardless, and have tended 'premie' babies, down to a 1/2 lb. that will fit in the palm of your hand. I'm a registered Respiratory Therapist with a perinatal/pediatric clinical specialty certification and have similar credentials for practice in Pulmonary Function Technology and Cardiopulmonary Technology. I've worked in the medical field for nearly 25 yrs, and I guess I've also worked with more knife and gunshot wound victims than most people. Not my cup of tea, anyway, my educational record is bizarre, with three 2 yr. Associate degrees and quite a few unrelated subjects. My transcripts read like: motorcycle repair, biochemistry, concrete, embryology, welding and mukluk making. If their was a degree program in Irreproducible Studies, I'd have my Masters. I've been politely and personally asked to immediately leave nice places by elk, moose, grizzly bear, rock slides, whizzing ball lightning and "the buzzing of the bee's" -- I'm not ashamed to tell you, I am trembling at the thought even now, which makes it all the harder to type. I can't rationally explain why I haven't died all the times I obviously should've, but whoever you are, I want to thank you personally - I recommend you highly to all. I've been a 60's Haight-Ashbury hippie, an American Marine with an Intelligence occupational specialty (I can't say much about that), have lived in a Zen monastery and used to be a fair rock climber. I still love my my old .45 and Ka-Bar Marine knife (well, it's true) and have a warm fuzzy feeling for shotguns, ancient cultures and the wrath of nature. I like handling bullwhips and throwing knives, tomahawks and axes. I'm a member of the Wild West Arts Club, a 600 member international stunt organization. I'm not all that good, but I do play. I've wanted to learn multi-strand braiding since I was a child and through the Thrower list have begun sling braiding which covers that nicely. Kind of a sportman's paradise where I live, so if you asked me to spear you a fish, I probably could handle it. I've been fortunate to meet and sometimes carea few celebrities, including Groucho Marx, Carole King and one large hawk in particular. I have the highest respect for people like yourselves (I know what I'm talking about here) and appreciate your company and experience, which is considerable. Thanks. Chris ----- Ted E. Bailey Hi

Everybody. I just subscribed to the Primitive Skills Group today. I found Chris' introduction quite interesting. I was a Haight Ashbury=20 hippie too and I just a year younger. Chris, did we meet in the Fillmore West over New Year's in 1968? Anyway, I am quite straight now. I even have short hair and I am an Engineering Manager. Now you know what happened to all those hippies! =20 My favorite hobby is boomerangs and throwsticks. I got into this primitive skills stuff as a young child growing up in Panama. The first toys I wanted my Mom and Dad to buy were the blow guns and shrunken heads that=20 the Choco Indians sold at the border towns. I used to spend all my time in=20 the jungle learning about the native animals and surviving on my own with minimal equipment. When I was 17, I left Panama and went to Arcata California to go to college. That was the beginning of my hippy days. =20 10 years later, I came out of the fog with a MS degree in Mechanical Engineering and I have been stuck in a middle class rut ever since. I throw boomerangs and put out a boomerang newsletter to keep me busy. I belong to the boomerang rang\_list and the thrower email subscription=20 group as well. I look forward to hearinrg more about the other subscribers. Cheers. - Ted -----

----- Alexander J. Pirchl About me: I live in Austria (Europ), particularly in Kitzbuehle in the Tyrolian mountains. I am 23 years old and married now for 1 1/2 years. I have always been fascinated by \*primitiv\* technology and weapons. Since=20 I was very small I have been toying around with knives, spears, blowguns, slingshots and slings. I also like all aspects of shooting, and owe quit=20 a number of firearms, but the power and accuracy one could get with=20 weapons made from the simpelest components have never ceased to amaze me.=20 Survival is also a topic which I find very interesting, and the question of=20 another member of this list stated in his introduction on what to stock up for a naural desaster would interest me very much. -----

----- Merv Martin Hi I'm Merv (Mervyn Martin). I was born in Red Bluff, California and lack=20 the strip between Izmir, Turkey and Taipei, Taiwan of having been around the=20 world. I'm ex-Navy (14 years, that's how I got to travel) and now work, when I=20 can find it, as an Electronics Engineer in Sacramento, CA. What else, oh,=20 I'm 45 and have just taken on two more kids, a 15 year old boy and a 12 year=20 old girl. What a glutton for punishment (that makes five kids)!!! Ah well,=20 I'm half adopted too and I like my step dad! I'm fascinated with anything I can do with my hands. In the past I've done well at surviving with a knife. I say well, I gained weight. I'm a pretty good trapper and only scruple at swallowing=20 uncooked bones. They're a bit scratchy (in and out). I can't say that I've tried grubs, but Caddis Fly larvae and Helgramites aren't bad. I've fished=20 with, but not eaten Stone Fly Larvae (Toebiters). Always wondered who'd get=20 the most bites. Salmon eggs aren't bad either, haven't tried frog eggs. I've info that may be of use. Like how to build a rope walk (a=20 "machine" for the manufacture of rope). I'll need to dig out the text for that,=20 it's an old Aussie book called "Bushcraft". Wow! Primitive Skills! Anybody wanna go fishing? Hook, Spear or=20 Trap??? BTW, the main reason I can gain weight on a survival test is that I know=20 the area and trap! Spinning cordage would be most important to someone like=20 me. I've used mostly grasses and 1/4 to 1/2 inch thick. This stuff usually=20 will take a jack rabbit (1/2"). Whew, I'd better close for now! Ya'll Take Care. Looks like a \_great\_ bunch of crazys here. Merv eaten\_by\_limestone@cliffhanger.com -----

----- Barent Parslow Hello all, I am very pleased to be a part of this group. I am a 23 1/2 year=20 veteran of the US Army currently serving with the Virginia National Guard and will retire in about 2 1/2 years. I am wondering if we are seeing a pattern develop here of the personality types that are interested in=20 this subject? I was raised by both my own parents, Dad a forester and Mom a teacher=20 and librarian, joined the Army out of high school, was a linguist working in intelligence, also served as a supply sergeant and in the infantry, was literate in Korean and Chinese, semi-literate in French, barely literate in English (especially after 5

years in Korea) and now the computer guru for my Brigade (if only they knew how little I really know). My hobbies include (when I can find the time): archery, hunting, shooting (modern and blackpowder), reloading, running (occupational), swimming, biking, computers, reading (voraciously), history (was my Brigade's historian), and community service. I am now starting to build primitive bows (an outgrowth of my interest=20 in archery, I have been shooting since I was 10) which lead to an interest in flintknapping (led to this list by post on knappers list), which has led to interest in the subjects this list should be exploring. Many thanks for starting this list. I hope to learn alot. Also, I would like to say that I don't believe that there is such a thing as a stupid question. No questions, no answers. I should also let you know that I am a little blunt (not that blunt, did that get sent, if so I apologize) No anger, just a little too straightforward sometimes. Tactless or so some have said. Sincerely, Barent Duty, Honor, Country parslowb@CFW.COM ----- James E. Burdine I am an R.N. that works in a Surgical ICU course, but I also have past experience in the E.R. I've been interested in survival and primitive technology ever since I made my first bow from a cherry branch at the=20 age of 5 and had the same bow broken over my backside after a shot went=20 wrong. On my mother's side of the family is Hessian German, and my mother still talks about the war years and things they did to survive hard times. On=20 my father's side is Scott/Irish and Am. Indian (either Cherokee or Blackfoot depending on who you ask) So I am quite happily a mutt. My Dad tell=20 stories about the big depression, and humorous experiences from his 30 years in=20 the Army (but would not until recently talk about his experiences in the=20 Korean war) I've rubbed elbows with some of the finest survivalists in the U.S. from the Rangers, Special Forces, and Force Recon (who talked to me even though I was a leg army puke) I messed about with throwing knives, bows, firearms of various types and .38 cal blowguns. I learned to fish, and camped with the Boy Scouts. I learned how to make a warm bed in nothing=20 but a pile of leaves (pile them up, dive in gently, and wait until your body=20 heat creates a pocket of warmth) What struck me as a disadvantage about survivalism is that most people separated from their kits would not be=20 able to survive, because older methods of survival had been lost. I felt that one should be able to be dropped anywhere in the wilderness and be able=20 to scrounge up materials needed to sustain life. Thus I started reading everything I could find about primitive technology, including what I=20 call neo primitive technology. Neo- primitive technology is old techniques=20 with non-traditional materials. For example slingshots use traditional bowhunting techniques with a high tech substance (vulcanized rubber) or using steel tubing to make a blowgun. Well that's enough hot wind for=20 now. JB jburdine@PIPELINE.COM (James E. Burdine) ----- Russ Brownlow Hey all, I too came to this list from the KNAPPER list. My name is Russ Brownlow and I've lived in Texas my whole life. Just moved to Houston after being in Austin for 8 years. I'm pursuing a master's degree in archaeology, possibly a PhD after that. I've been involved in wilderness survival pursuits since I was a kid in Scouts. I became an Eagle Scout at 16 and have been roaming the wilderness since. I'm not a hardcore militant survivalist, but I usually work deep in the woods, so I get along OK. I haven't had to eat any bugs to survive though. I'm an archaeologist for a company out of Austin, and we do surveys, testing, etc. across the country. I wasn't around at any of the concerts you guys were talking about, but I might have been conceived at one of them early in '69. Although I'm not a true hippie, I like to think that I would've fit in well back in the day.=20 I work for an environmental firm out of Austin, TX. We do biological as well as cultural resource management type stuff. Whenever a pipeline, a transmission line, well pad, coal mine, etc. are planned, we go out and survey the area for any archaeological sites. If we find any "significant" ones, we test them. If testing proves that they are more than just the run of the mill scatters, we often excavate them. =20 Yes=20 I've found all sorts of Native artifacts, its pretty much a daily=20 occurrence when=20 we're out in the field. I also work in the lab were I do whatever has=20 to be done. =20 My main job in the lab though is the illustration of the artifacts for publication. I'm an archaeologist and an ARTaeologist I guess you could say. We find lithics and pottery, but no mummies down here. We do have the occasional burial, but rarely. No signs of weaving since this area of Texas has acidic sandy soil that pretty much dissolves everything that is not rock. As for my "time travels" as an archaeologist, those hopefully lay ahead of me. I've been doing this for a while now, but only for about the past four years professionally (that is, getting paid for it). That is why I'm pursuing higher degrees, otherwise I'm relegated to being a hired shovel bum. I have run several projects, but technically I don't get the credit since the law requires a Master's degree to do so. Soon that will be taken care of. I did go to the Middle East for a while. You can find artifacts there all over the place (just walking down the road). I was chasing a herd of camels in the desert once and found an area where the wind had deflated some dunes. I found several flint cores, some pottery (that dated to around 200 B.C. from Syria), mussel shells from the ocean, and two hearths with burned bone in them. People have lived there for thousands of years so I guess it is no surprise that there are artifacts everywhere. I even found an old net weight made of stone washed up on the beach. That is about as extensive as my travels go (oh yeah, I hung out in Amsterdam for a while :). Otherwise, I've just travelled all over Texas digging sites. As for the tribes, that is hard to say. Most of the stuff is Archaic or Paleo so we have no idea who the tribes were that far back. Of course some of the upper layers have artifacts usually associated with the Karankawa, Cherokee, Apache, depending where you're at in the state. Other than that, I'm just the young hippie type trying to make a living by having a good time out in the woods looking for stuff. It's a pretty "groovy" job. PEACE, ^/\ / \ / \ / Russ \ ( \_ ) ( ( \_\_\_\_\_ ) Russ & Rebecca Brownlow -----

----- Greg Biddle Heya all, First let me introduce myself a little. My name is Greg Biddle, I'm an archeologist, currently working in Juneau AK. I have worked all over=20 quite a bit of the western and midwestern US. I have been flintknapping for about 7-8 years and have been interested in / practicing 'primitive'=20 skills since my uncle taught me how to shoot a bow, bareback from a horse, and=20 how to cure squirrel pelts with table salt (Sorry Mom!?) I am really=20 enjoying this group, although I was getting a little worried about the 'fish bombing' thread!! Remember a hunter in a primitive community didn't just >> hunt for himself. he hunted for his village and family as well. No one, >> went away hungry. It's funny isn't it that we call them primitive. >> JB Good point! Primitive people were surviving and feeding their families and sometimes other peoples' families. Some have the tendency to over romanticize primitive peoples hunting practices. But there are accounts of Native American tribes burning down entire forests in a circle just to chase the animals to the center of the forest so they could be slaughtered. There are also accounts of running entire herds of buffalo over a cliffside. So, if one were in a survival situation and had multiple mouths to feed, it would not be unlike the first peoples if we used an explosive of some sort. On the other hand it would be a shame and disgrace to use them for any other purpose. Even if one felt the need to test the effectiveness of this technique, they should plan a group feast of some sort or feed some poor community. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. For a 2+ minute dive, you need to spend about 5 minutes of slow deep breathing on the surface saturating your body with oxygen. You will know when you are ready. When you start the dive, take a full deep breath and then let a little bit of air out. Do not start the dive completely full. Go down slow. Keep your energy expenditure to a minimum. As you descend and need to clear your ears, hold your nostrils and blow. You must rotate your head into an "up" position when doing so. When you reach the bottom, don't chase fish. Stay still and they will come to you out of curiosity. After about 60-75 seconds, you will start to feel pain in your lungs. This is not because of a lack of oxygen. Instead, there is a build up in the partial pressure of carbon dioxide. Let a few bubbles out and the pain will go away for about 10-15 seconds. You can repeat this about 4-5 times, each with diminishing effects. The ascent should be as slow as the descent. Plan your time appropriately. With practice, you should be able to do 2+ minutes. Hope this helps. All of the above I did in tropical waters. You will never get me into the frigid waters of Michigan or Canada. - Ted Ted Bailey || email to: tbailey@ic.net P. O. We don't have it up here in northern Qu=E9bec, and I'd > sure like to look it up. >=20 > Thanks >=20 > Andr=E9 Andr=E9, I believe naturalist Christopher Nyerges gave common names for some Buckeye varieties as California Chestnut and Horse Chestnut. Benjamin Pressley pointed out that their scientific names could be found on the "Ethnobotany Cafe" website's databases. I checked and under Native American Medicinal Plants, found the following. Here's three listings - the first for California Buckeye and the second and third for the horse chestnut. Notice the specific mention of Native American Indian usages for food, medicine and as a talisman. I can tell you that it looks like large nut with a smooth hard brown shell. Kind of like a giant Filbert in appearance Hope this helps. They are 18th and 19th Century reenactor suppliers. You can get a Green River Buffalo Skinner or a Heavy Skinner blade blank and cutlery rivets and walnut handle slabs, all for under \$15 (not counting the hacksaw and sandpaper or equivalent you'd need). These knives look like a steel boomerangs. Take a look and see if that's the "Crooked Knife." Loads of all kinds of neat stuff. I like their Throwing Knife, their Leaf Shaped Spear Point and their wrought iron flint stiker. Jason Townsend and Sons, Inc. <http://www.jastown.com/newhome.htm> Chris Smith

Look in places like stream banks, road cuts (sides of a hill exposed), even river bottoms. A good initial test for whether what you think is clay will have the elasticity needed is to roll out a long snake, then make it into a circle, pinch the circle closed, then hang it on your finger and bounce it gently. If it will doo all these things without falling apart, you probably have some good clay. To clean the clay, add enough water till you have a slurry. Let it set for 20-30 seconds, allowing the heavier stones to settle. Then carefully pour off the thinner clay solution into another container (you may need to do this everal times). Then set the slurry aside for several days. The heavier clay will sink to the bottom and the liquid may be drained off. Clay may be stored moist or dry. If you store it moist wrap it in plastic and store in a cool, dark, dry place. If you allow it to dry then you can store it and reconstitute as needed by crushing it up fine and adding water till you get the right consistency.

Message-ID: <12E797D129E@takila.uku.fi> Hi all primitives My name is Heikki Niskanen and subscribed to primitive-skills-group on friday. After that I have received 106 e-mails. This is too much for me, have to unsubscribe or signoff as you say. It would have been interesting to discuss with you on the list. If you want to discuss with me about these things you can send mail straight to me adress below. I have been wandering, shooting the rapids, hunting in northern lapland, Finland. I have had many good tricks and tips from Samish people and one forest guide concerning what and how to do things in wilderness. Anyway, thanks for the short acquaintanceship. It is functional pottery that can be made from clay found and fired in a camp fire. I hope everyone saw my previous post, though that it is possible that there may be poisonous elements in the clay you gather. the only way to be 100% sure is to have it chemically analyzed. But neither I nor anyone I know has ever had any problems with this. I have cooked in pottery and also cooked squirrel, fowl and fish in sticky mud or clay and have never worried about it and have never got sick. I'm not downplaying the importance of this concern, just stating that I or no one I know has ever had any problems with it. To thine own self be true. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. Also, I do remember that they had some glazed decorations on them. >>Thanks for jogging my memory. >=>20 > Fred You bring out a good point. NEVER cook in a bought piece of pottery unless you have bought it from someone who has made it for utilitarian purposes, i.e. safe to cook in. Even buying pottery from the Catawba people who are one of the people that still practice the art of producing pottery in this primitive manner, should be questioned. For they produce their pottery in most cases to sell to the tourists who will not be using it to cook in. At very least, pottery improperly prepared for cooking purposes will not hold up under fire used in cooking. It is safest to make your own, if you are going to cook in it, however, if anyone wishes to purchase pottery I can recommend a source. I can also recommend a safe source of clay in Bethune, SC. He sells clean clay, ready to use for \$4.00 for 25 lbs. (Inquire about shipping costs).I have used it many times. It fires well and I have cooked in pottery made from it. Anyone interested in this clay can contact: Bethune Pottery, Rt. 2, Bethune, SC, Phone: (803) 334-8346. ----- Benjamin Pressley benjamin@perigee.net Primitive-Skills-Group@uqac.quebec.ca Snail Mail: TRIBE P.O. quoted-printable Sorry, I too would like to have a source for crooked knives. I know of a museum who purchased some replicas, but I'll have to find out where. I make my own crooked knives from old files or old sawblades, because I use them a lot when I make birchbark canoe ribs and planking. I find the commercial crooked knives too long for comfortable leverage, and I don't usually like the angle of the handles. This is a very personal tool, and you will get sore real quick if it doesn't fit your hand just right. And -----

Box 20015 > Charlotte, NC 28202 > USA > E-Mail: tribe@perigee.net > TRIBE Homepage: > http://users.aol.com/tbprim1/Tribe.html > Information On TRIBE Gathering: > http://users.aol.com/tbprim1/Tribe\_Gathering.html >> Also Check Out Ted Bailey s Calendar of Events for Primitive Skills > Classes and Events: > http://users.aol.com/tbprim1/Prim\_cal\_events.html I have to agree that I have seen many sig files as long or longer than Mr. Pressley's. I don't particularly like them (please don't be offended) as I find that I ignore any content over 3-4 lines because I will see the sig and be done with reading the article/message. In fact I am going to shorten my own sig file. Is this a big problem? No. However, I am also finding it difficult to remember to modify the address when I return mail because this server adds the contributor's e-mail address. I do not want to double anyone's load, and I notice that most of us are trying not to, but it does happen and has happened to me. I also am considering using the digest function if it is available, just to save time. However, I think that it will be more difficult to sort the threads. Dang, just can't have it all. I love the list though, and am learning or relearning a lot. -- Sincerely, Barent

I have a hard time finding straight Mullein (Verbascum spp) here in the north. Also, do you have a reference to that Ishi book you are mentioning? Thanks for sharing, great stuff! >> I use Mullein fire board and stalk. Suitable spindle pieces are about 10 to 20 % of all stalks from what I have found, so keep looking. The business end (bottom end of stalk) of the spindle is 3/8" to 7/16" in dia. and the stalk is 20 to 28 inches

long. Often you will find a suitably straight piece somewhere along a longer stalk so don't just look for 20 to 30 inch stalks, you'll be looking forever. I have been successful with stalks 18" long, but the longer, the better (easier). Split mullein stalks as fire board can be any diameter larger than at least 1.25 to 1.5 times the diameter of the spindle. The thicker the wall of the stalk you use for the fire board, the better. There is more "meat" in the material and therefore less chance of pushing or burning through before you get a coal going. Sometimes you can find one stalk which is tall enough to get both parts from but more often you need to use two separate stalks. Larger stalks serve best as boards, thinner (but not too thin) and straight stalks serve as spindles. The pith should be left in the board as it helps condition the spindle and I think helps produce a good powder reservoir to heat up to ignition (smouldering coal) temperature. Start the spindle circle in it nearer one side or the other then cut the notch. Successive "holes" can be formed down in a row spaced every 3/4 inch or so. A used stalk board looks like a spent cap-gun roll of caps. Lastly, I use a piece of flattened wood (a wood fire board would work fine) to place the mullein fire board on top of and which the powder coal forms on. No tinder is necessary. Actually, tinder at the face of the notch packs and suffocates the coal powder. Too much pressure and too slow twirling of the spindle are two common errors which will defeat success. Take your time in developing calluses on your hands as well. You will no doubt get blisters and have to lance them, let them heal a bit and start again when they dry. Keep on trying. Good luck. Glad to help out.

 18:54:17 EST Sender: owner-primitive-skills-group@vaxcha.uqac.quebec.ca Message-ID: <32C76744.2744@saglac.qc.ca> Date: Mon, 30 Dec 1996  
 06:55:00 +0000 From: Dr AF Bourbeau Reply-To: PRIMITIVE-SKILLS-GROUP@vaxcha.uqac.quebec.ca, bourbeau@saglac.qc.ca MIME-Version: 1.0 To: Primitive Skills Group Subject: Flint & steel tinder Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable I received a very important post in french from Pascal Chauvaux of=20 France who is a member of our group. For those who don't read french, I=20 have translated the essential at the end of this: >Andr=E9, Merci de m'avoir indiqu=E9 le PRIMITIVE-SKILLS-GROUP ! J'ai rencontr=E9 quelques difficult=E9s pour m'abonner, mais tout est bie= n=20 maintenant. J'ai re=E7u d=E9j=E0 plus de 80 messages, et cela semble bien int=E9ressant. Un des domaines qui m'attire le plus est la production de feu. Nous=20 avons, avec quelques amis d'une association arch=E9ologique de la r=E9gion de Li=E8ge en Belgique, beauco= up=20 travaill=E9 la production (pr=E9historique) du feu. Si cela t'int=E9resse, je peux t'envoyer la cop= ie=20 d'un article que nous avons publi=E9 (en Fran=E7ais) : L'obtention du feu par percussion : approche exp=E9rimentale et=20 trac=E9ologique, in Bulletin des Chercheurs de la Wallonie, Tome XXXI, 1991, 19-49. On y parle notamment des initiateurs (champignons) test=E9s. J'ai de bons contacts avec des arch=E9ologues suisses, et j'ai re=E7u un=20 article indiquant les champignons utilis=E9s (une quinzaine) par les n=E9olithiques du lac de=20 Neufch=E2tel en Suisse. Quelques-uns =E9taient des initiateurs pour le feu. En ce qui concerne le feu par friction et percussion, je connais un bon=20 sp=E9cialiste fran=E7ais : Jacques Collina-Girard. Il a publi=E9 quelques articles int=E9ressants, et je peu= x=20 t'en faire parvenir une copie si cela t'int=E9resse. Nous nous sommes sp=E9cialis=E9s dans les briquets en fer, et j'en ai=20 d'ailleurs forg=E9 une quarantaine la semaine derni=E8re. Il faut dire que nous avons fait des recherches=20 r=E9cemment, et que la plus vieille occurrence d'un briquet en fer remonte =E0 400 BC. Il s'agit de 3 briquets=20 en fer provenant d'une s=E9pulture collective de l'=E2ge du fer (La t=E8ne), dans la grotte Ambr= e, =E0=20 Eprave en Belgique. Ils ont une forme tr=E8s diff=E9rente des briquets en fer connus. J'en ai quelque= s=20 copies, et si tu es int=E9ress=E9, je peux t'en faire parvenir un (avec les dessins des pi=E8ces originales)= .=20 Je voudrais d'ailleurs le faire savoir au PRIMITIVE-SKILLS-GROUP. Peux-tu leur transmettre un=20 message leur proposant gracieusement un briquet en fer. Je m'engage =E0 envoyer gratuitement un=20 briquet et quelques explications =E0 ceux qui m'en feront la demande. Comme chaque ann=E9e, le premier jour de l'an, je vais me promener au Cap= =20 Blanc Nez, au bord de la mer entre la France et l'Angleterre, o=F9 ils ont creus=E9 le tunnel sous= la=20 manche. On y trouve du silex dans la craie, mais aussi =E9norm=E9ment de marcassite, le fameux bisulfu= re=20 de fer qui est attest=E9 comme le plus ancien proc=E9d=E9 de production de feu (tant que l'on ne=20 retrouve pas une drille en bois). J'ai toutes les r=E9f=E9rences des sites o=F9 on a retrouv=E9 de = la=20 marcassite (pal=E9o sup=E9rieur). Je peux =E9galement t'envoyer un kit complet : marcassite, briquet en silex, =20 amadou. Voila, j'esp=E8re que si des renseignements que je te fournirai sont=20 int=E9ressants, tu auras le courage d'en faire une traduction sommaire pour le faire savoir aux membres du PRIMITIVE-SKILLS-GROUP. Mon anglais n'est pas assez bon pour le faire=20 moi-m=Eame. Merci pour ton obligeance. Meilleurs voeux de sant=E9 et de prosp=E9rit=E9 =E0 l'occasion de l'ann=E9e= e=20 nouvelle, =E0 toi et aux membres de ta famille. Pascal Chauvaux Pascal.Chauvaux@gate71.be Ok, here's the gist of the post: Pascal and others in France in archeological circles have worked=20 severely hard for a long time on flint & steel tinder. They found=20 references to 15 types of fungi which were used for flint & steel tinder=20 and tested them. He has offered to send me scientific articles on all of = =20 these experiments conducted in Europe and Switzerland especially, but=20 they are in french. His group has specialized in making striking bats based on a very old=20 one they discovered which is dated 400 BC. These bats are apparently=20 quite different from the ones we know about. =20 Pascal has offered to send a

replica and drawings of the original to=20 those of the group who want one free of charge! (I'm not sure that he=20 will be able to do this when he finds out how many of us will be=20 interested!) He says that in the undersea tunnel which was dug years ago between=20 England and France, that they have discovered Marcassite and other=20 evidence of primitive fire making ways. Wow, thanks for such a great post, Pascal, and in the name of the group,=20 thanks for such a generous offer. Please, everyone, send your requests directly to Pascal by private=20 E-mail, not to the group. =20 Andr=E9 ----- Surviving at nature's will...=20 Dr Andr=E9-Fran=E7ois Bourbeau =09 Professor of Outdoor Pursuits University of Qu=E9bec=20 555 University Boulevard=20 Chicoutimi, (Qu=E9bec) CANADA G7H 2B1 418-545-5011 Ext 5259 At Nature's Will Inc. 3801 Rang St-Martin Chicoutimi, (Qu=E9bec) CANADA G7H 5A7 418-543-2888 bourbeau@saglac.qc.ca -----

It seems to me that the shorter bow would be easier to manipulate ( i.e. carry, conceal, etc...) in a stalking/hunting situation. The bow and the arrows are held easily against the body allowing for unrestricted movement through and around obstacles. It also seems that a 12" arrow is much easier to make and eventually replace in a survival situation. My experience is limited to the longer bows but this now has my interest. I suppose, for the true 'off-trail' hunter, a 12" draw is all you would need! CC: tbailey@IC.NET Do not do that!! You can be hurt bad!! Folks smater than I will be telling you why vary soon. Please go and buy this book The Art of Flint Knapping, By D. C. Waldorf. It will cover the basics, such as tools, raw materials, percussion, pressure, and indirect percussion flaking techniques, as well as advanced theory and practice. You may be able to get this book at the Library. This book was of great help to me when I first started and still is. Also go to this URL http://www.ucs.mun.ca/~t64tr/knap.html This is the Knappers Anonymous Homepage you can get all kinds of information on Knapping, such as where to get the tools for knapping what is safe to do and what is not safe to do. Do not let your students knapp until you have checked all of this out. There are things you must do to make this a safe hobby. Here is another homepage to check out. This is called the Knapper's Corner it too is a good homepage http://www.eskimo.com/~knapper/ Good luck Gary Lowell Salem, Or USA At 08:25 PM 12/30/96 -0400, you wrote: >Is there anyone who is an experienced knapper who can answer this email >inquiry for me. It seems to me that the shorter bow would be easier to manipulate (i.e. carry, conceal, etc...) in a stalking/hunting situation. The bow and the arrows are held easily against the body allowing for unrestricted movement through and around obstacles. It also seems that a 12" arrow is much easier to make and eventually replace in a survival situation. My experience is limited to the longer bows but this now has my interest. I suppose, for the true 'off-trail' hunter, a 12" draw is all you would need!<< I am sure there are many more experienced archers out there with more information on short bow applications, but here is my experience. I made a 24" bow of fire-hardened oak. The main advantage of such a bow is that it can be made in an area with not a lot of straight wood of the right length. You can almost always find two feet of straight wood. The main use for this type of bow is in set hunting. Set hunting is hunting from a camouflaged position along the side of a trail or run. Because of its size, the snap bow is not incredibly accurate. Set hunting fortunately is typically very close range and requires a hard fast shot. My oak bow draws about 35 lbs, draws about 14", and has a problem hitting much beyond 10 feet. I can hit a milk carton pretty regularly at 8', nbut forget 15'. It is a limited application bow, but a nice one to have in your repertoire. By the way, set hunting of this nature is an art form that requires enormous skill and patience. You must de-scent, stalk into an area, camo yourself without disturbing the landscape, and then sit motionless for hours. When a deer finally ables by, you have to very slowly move into firing position. Have I done it? Only in my dreams. Deer are very wary. It is a tough way to hunt. I believe it would be possible to use it for stalk hunting, but you would have to be very good to get within 10' to where you could actually hit anything. It does not get hung up in the brush however. They are fun to make and shoot however. Kevin Reeve

Forest cutting, mining (contamination of the water by mercury), and agribusiness (cattle and farming) are about to swipe the viable forest from the face of the earth. I would say that survivalist in the future will have a very difficult time at best what with the competition for the diminishing wildlife, plants, and water. As Tom Brown Jr. suggests in his on line interview (AOL - sorry I don't have the date), the survivalist of the future will have to seek out the most inhospitable terrain he can find in order to avoid the onslaught of food seekers. Sorry about the air of doom, but I can see it coming. JW

I can see that there is an over-abundance of e-mail already, so I will keep this as short as I can. We operate Hollowtop Outdoor Primitive School (HOPS) in Pony, Montana. If you would like a brochure of our books and classes send your postal address to tomelpel@3rivers.net. Mailing lists are expensive to maintain, so please ask only if you are seriously interested. Below is a promotional for one of my books: Thomas J. Elpel's Field Guide to Primitive Living Skills Primitive living is a way of learning about nature by participating in nature. Instead of merely camping in the wilderness or passing through it, you can become part of the process. You discover nature by using it to meet your needs for shelter, fire, water, and food. Tom's guide will give you a direct, hands-on experience of the world around you. With this book you will have the opportunity to discover the thrill of staying warm and comfortable without even a blanket! Experience the magic of starting a fire by friction. Learn about the edible plants of the Rocky Mountain region and the techniques to process them, plus "primitive gourmet" cooking skills. Tan the hides from your fall hunting trip, and manufacture these into durable clothing. Also covered are: primitive bows & arrows, sinews, hide glue, backpacking, felting with wool, fishing by hand, stone knives, wooden containers, willow baskets, twig deer, cordage, stalking skills, trapping, and tire shoes. Thomas J. Elpel's Field Guide to Primitive Living Skills includes dozens of innovative skills and 160 photographs, plus an encompassing philosophy. Tom does extensive research and development of primitive skills. He places an emphasis on publishing new information that is not found in any other source. The cost is \$17 plus \$3 priority postage. Send check or money order to HOPS, Box 691, Pony, MT 59747 or use your Visa or Master Card and call 406-685-3222. Watch for more of Tom's writing in these publications: The Bulletin of Primitive Technology - 2 issues per year, \$25 - Box 905 - Rexburg, ID 83440. BackHome - 6 issues per year - Box 70 - Hendersonville, NC 28793. Wilderness Way - 4 issues per year, \$18 - Box 203 - Lufkin, TX 75902-0203. The Mother Earth News - 6 issues per year - Box 56304 - Boulder, CO 80323-6304. Questions? E-mail me direct at tomelpel@3rivers.net. Always Peace, Thomas J. Elpel

These hexagonal devices, which you find on the end of every M16, channel the flame that comes out of the rifle into six narrow channels out to the side. You can also get flash suppressors with only 4 of the 6 channels open; I believe this is so you can counter the rifle's upward kick by pointing the closed channels down. It also provides a more intense flash out of the 4 remaining channels and should work better. Problem is that threaded barrels are generally illegal in the US. Phil

use of the resources at hand. It will be those that are willing to learn the old methods and keep them alive that will teach those that will survive. So  
called primitive methods work because their ancestors learned and proved their methods in the labratory of nature. Failed experiments didn't  
survive into the next generation. JB

day supply of food available for sale. When the electicity goes, you have the supplies in your kitchen and the gasoline in your car (250 - 400 miles or

less in traffic, lots to traffic). That wont get most of us out of harm's way and everything we take for granted wont be accessible without electicity to pump it, prepare it, store it, etc. If you survive the 48 hours, then your primitive skills need to make the most of what is available to you - your own backyard.

I just raked the knife blade along the length of the flint piece (about 2.5in. long X 1/8in wide), and got a large swoosh of sparks that when done close to the little pile of cattail fluff, resulted in an explosion of flame. The fluff burns out rather quickly, but with some dry leaves or other tinder next to it, results in a nice warm camp fire. J.W. =====

We don't have it up here in northern Qu=E9bec, and I'd=20 > sure like to look it up. Hey, I can help on this one, finally (living currently in Dayton, Ohio)! Buckeye, Aesculus glabra, a medium-size tree with a range from the Alleghenies to central Texas. Produces a foul-smelling odor when its leaves, bark or twigs are crushed, hence the nickname "fetid buckeye." Oh, and the chestnut-like seed is poisonous, so don't eat 'em. Wood is fairly light and easy to carve, but fairly scarce these days. -glen monaghan

As far as I know there is no problem owning a weapon with screw threads cut onto the barrel end. What is regulated is the possession of a silencer. This isn't illegal to own but heavily taxed, and severely regulated. As long as it isn't illegal to own locally, you can work through your local sherrif's office and Class 3 dealer to obtain a class 3 tax stamp to own either a fully automatic weapon or a silencer. I fired enough full auto while in the army, and the only ones I thought were any good were tripod mounted, you could really reach out and touch someone, otherwise they were a waste of ammo. Silenced weapons on the other hand, well lets say I like them, but for a \$300 tax stamp and all of the trouble you have while you own them(you must notify the BATF and all law wnfocement agencies ahead of time before you are going through their areas when you are moving the weapon. If you are relocated by your company you bettered hope that silenced weapons are not illegal in that area, or you will have to find someone to store your weapon with) they may not be worth the trouble. Besides that, they really don't cut down the sound much more than you would experience with a rifle barrel and CB caps. My apologies for straying into non-primitive weapons as far as I have. JB

 Sales & Info Services > Ph: (313)-971-2970 || Fax: (313)-761-3632 > Internet Address: http://ic.net/~tbailey/ HERE WAS MY ANSWER TO THIS  
 PERSON: I am glad to answer this question. The answer is that this is only a myth. It is not possible to control the shaping/knapping process in this  
 manner. As near as I can figure this comes from an old Edgar Rice Burroughs, Tarzan novel. Stone tools and points are produced from many types  
 of stone, including obsidian. They are produced by striking the stone with a billet or hammerstone in such a way that the energy travels through the  
 stone and causes the stone to break off predictable, controlled flakes. The tool is further finished, depending on the tool, by using an antler tine or  
 copper wire mounted into a handle as a pressure flaking tool. This is a very simplified explanation.=20 For more details I can recommend some  
 classes from people who teach this process known as flintknapping. I also recommend the following books: Flintknapping Flashcards by Errett  
 Callahan (Piltown Productions) Flintknapping: The Art of Making Stone Tools by Paul Hellweg (Canyon Publishing Co., ISBN: 0-942568-05-2)  
 The Art of Flintknapping by D.C. Waldorf I also recommend the following teachers: Errett Callahan, Piltown Productions, 2 Fredonia Ave.,  
 Lynchburg, VA 24503 Errett Callahan specializes in and conducts workshops in flintknapping, primitive skills, archery, etc. and sells stone knives,  
 flintknapping supplies and a starter set for the beginning flintknapper, complete with instructional flashcards. Catalog available. He is very  
 renowned worldwide as an exceptional experimental archaeologist. He is founder of the Society of Primitive Technology. Jeff Holshouser, 8535  
 Bringleferry Rd., Salisbury, NC 28146, Phone: (704) 639-9082 Jeff teaches some excellent workshops on flintknapping, especially for those just  
 starting out in flintknapping. He also collects artifacts and sells casts of originals and will do other replication. Flintworks, Scott K. Silsby. Rt. 1, Box  
 2426, Front Royal, VA 22630, Phone: (703) 636-4824 Scott is the best teacher and tool maker, when it comes to greenstone tools. He also teaches  
 workshops In flintknapping. bow and arrow making and sells greenstone and greenstone tools. Boulder Outdoor Survival School, Inc., P.O. Box  
 1590, Boulder, CO 80306, Phone: (303) 444-9779 B.O.S.S. has much to offer In primitive and survival skills workshops from a week to 27 day long  
 hands-on training. Write for a schedule of classes and products they have available. They are also a good resource to connect you with some  
 particular craftsman, book or resource you may be having trouble locating. Dave Wescott is director and is well known for his contributions and  
 and skills in primitive and survival technologies. He organizes Rabbit Stick Rendezvous and is editor of the Bulletin of Primitive Technology. Barry  
 Keegan, Pathways School, 6 Heather Lane, Elmsford, NY 10523, Phone: (914) 592-8961 He and his partner, Anthony Follari are two of the most  
 skilled people I have met. They communicate well and their experience in the field is apparent. Write for a full schedule of their classes. The  
 following organizations and newsletters are also excellent resources: Michigan Flintknapper=92s, Robert Love, 8185 Kiowa Trail, Pinckney, MI  
 48169 A group of flintknappers and primitive technologists that meet regularly and hold annual events. They are donation supported. To maintain  
 membership you must be actively contributing to the group in some way or by contributions, suggested, \$10.00. They have a fine news letter for all  
 members and contributors to their group. Great Lakes Primitives, George Hedgepeth, Editor, G-3450 South Linden Rd., Suite 119, Flint, MI 48507  
 Newsletter on various primitive skills and activity focusing on activity in the Great Lakes area. \$10.00 per year Bulletin of Primitive Technology,  
 Society of Primitive Technology, P.O. Box 905, Rexburg, ID 83440, Phone Voice/FAX: (208) 359-2400 More than a magazine, the official bulletin of  
 the Society of Primitive Technology. The most highly technical, yet understandable, magazine on various primitive technologies I have ever read.  
 Contains articles by all the big names in these technologies. Join the Society and order their back issues while you can at \$10 per issue. Free  
 classifieds for members. (\$25.00 year). Subscription price includes annual PrimitiveTechnology Newsletter. ALSO CHECK OUT MY HOME PAGE  
 BELOW FOR OUR CLASSES, ANNUAL EVENT AND SOME GREAT LINKS! -----

Local natives did use the buckeye as a backup to acorn, preparing it in much the same way. So California buckeye is reputed to be edible when leached, though I will let you know after the ones I have gathered have dried and I prepare some. It is supposed to have needed more leaching than acorn and did not taste as good. Another use of the buckeye by the locals was as a fish poison. They would either make a dam or use a natural deep hole where fish were likely to be, and dump in a basket of ground buckeye. This was supposed to have knocked them out and they floated to the surface for easier gathering. BTW, in my area, the California buckeye produces an enormous fruit compared to the eastern variety, perhaps 2-3" in diameter. I have also heard that the nectar from the flower is poisonous to bees. Again, I cannot personally vouch for this. Hope this is new information. Kevin

Topics which you are encouraged to discuss with other group members are: 1. All primitive wilderness living skills such as shelter, fire, cordage, primitive tanning, natural foods, primitive living, primitive rafts & boats, primitive direction finding, primitive trapping techniques, weapons for wilderness survival, primitive hygiene, protection from insects, primitive weather prediction, fighting cold, primitive medicine, traditional dog sledding, edible plants etc. 2. Subjects related to modern realistic wilderness survival, such as surviving unexpected emergencies after airplane crashes, broken down snowmobiles etc.=20 3. Discussions about environmental concerns related to the practice of primitive skills are also welcome. Remember! This group is intended for fun, sharing and learning about primitive wilderness survival and living skills. All members will be=20 asked to refrain from discussing topics related to specific religious, political or ethnic views." In number 2 above, learning how to make a fire with a gun might save a=20 hunter's life when he gets lost in the wilderness. That's why the=20 subject is welcome on this list. Hope this answers your question. The fluff bu= rns > out rather quickly, but with some dry leaves or other tinder next to it= , > results in a nice warm camp fire. >=20 > J.W. Ok Jim, you had me fooled there for a while! What you are referring to=20 is a commercial flint striker which is made of magnesium with a striking=20 insert made of (what's the name I'm searching for?) ium. This magnesium=20 match puts off a very very hot spark that will make just about any kind=20 of good tinder flame up. However, when we talk about flint and steel here, we are talking of=20 natural flint pieces struck with a piece of steel. I don't know of=20 anyone who has found any natural tinder fine enough to catch that kind=20 of spark other than the fungus Inonotus obliquus. That's why I was so=20 surprised by the cattail story. Just goes to show how simple details can mislead one's thinking and get=20 some authors writing down things which do not work. Thanks for helping us clear this up. MANY INTRODUCTIONS. Content-Type: text/plain; charset=iso-8859-1 Content-Transfer-Encoding: quoted-printable Hi everyone, Since we have received over 40 new subscriptions in the last couple of=20 days, I am posting this list of introductions again. I know it's=20 bothersome for those of you who have already read these, but those who=20 haven't I'm sure will appreciate... Andr=E9 ----- PRIMITIVE SKILLS GROUP-- INTRODUCTIONS This is a list of the introductions sent to the primitive skills group=20 by some of the members. The introductions are listed in the order in which they were received. This file can help you feel at home by=20 learning about some of the people which make up the group. If you=20 would like your name added to this list (or removed) or if you would like to change the content, just let me know. Andr=E9-Fran=E7ois Bourbeau List manager bourbeau@saglac.qc.ca ----- Andr=E9-Fran=E7ois Bourbeau Hi everyone, my name is Andr=E9-Fran=E7ois Bourbeau and I'm a professor at the University of Qu=E9bec, Chicoutimi campus, where I teach outdoor pursuits in an adventure tourism bachelor's degree. This 3 year program is in french, so unfortunately much of the material I have developped will have to be translated before it is useful to many of you- sorry about that. I have been at the university for 15 years now, teaching courses such as winter camping, whitewater canoeing, wilderness survival, outdoor leadership, environmental awareness, philosophy of outdoor education and such. I also have research duties, and my field of interest is "coureur de bois" and wilderness survival. I did my doctoral thesis on how to write clear instructions for primitive wilderness survival techniques. Since then, my research methods have been largely experiential: basically, I put myself in simulated situations in order to learn about old ways and develop new knowledge. I conducted two major trips, one was a 31 day experiment in 1984 where I was dropped by helicopter on the 50th parallel without food, without fire, without tools, without shelter- just the light clothes on my back. That was a pretty rough trip, details of which are to be found in a book I wrote about the experience entitled "Survie au Gr=E9 de la Nature"- sorry, only available in french for now. The book is a day by day report on the trip, to which was added a scientific report on various subjects studied during the experiment. The other major trip I did was in 1988, a 40 day reconstruction of a trip along the fur trade route in the year 1838. All the materials used were authentic reproductions of the period's gear, including real birchbark canoes and even handsewn underwear. This trip is documented in a film by KEG productions of Toronto called "Man of the Wilderness" which has been translated into many languages and has been shown on many television networks around the world. My main interests are in developping wilderness survival techniques for someone lost or downed in the boreal type forest. All ideas I find from other parts of the world I try to adapt to materials found here. For example, fire saws are possible with bamboo- I try to find materials to make it work here (haven't found any yet). I am really looking forward to all the fine discussions I am certain will develop as the Primitive Skills Group grows. By the way, I am the list manager for the group, so any concerns you may have about the way the group functions can be addressed directly to me. Finally, please note that I love hamburgers and french fries, but no ketchup. Thank you, Andr=E9-Fran=E7ois Bourbeau bourbeau@saglac.qc.ca ----- Benjamin Pressley My name is Benjamin Pressley. I teach primitive, survival and wilderness living skills. I write for several magazines like American Survival Guide, Backwoodsman and Wilderness Way. I co-founded an organization called TRIBE that now has members in 46 states, Canada, New Guinea and Guam. I publish a newsletter for TRIBE also that many of you will find interesting, I'm sure. We are a network that operates non-profit to connect people interested in primitive skills with resources and other people. I am skilled in many areas of primitive skills. Shelter building, fire making, water sources, some edible and medicinal plant knowledge (enough to get by), tools from stone, shell, bone and wood, braintanning animal hides, traps and snares, fishing technologies, cordage making, lighting methods, cooking without aid of modern utensils, and much more. Hunting Weaponry is particularly an interest of mine. I teach classes year-round and do a lot of demonstrations for schools, museums, etc. The particular weapons that my research has been in are slings, bolas, atlatls, non-returning throwing sticks, blow guns. I will be glad to help out anyway I can with questions, etc. If you are interested in primitive, survival and wilderness living skills that I have please inquire. My skills are based on skills used by primitive people for thousands (more?) of years. If you want more information about our organization, TRIBE, check out: <http://users.aol.com/tbprim1/Tribe.html> Ted Bailey does this homepage for me. As I get more Internet/Web page savvy I plan on putting out a mini-newsletter for people interested. For now, check out that site and it will tell you more about what we have to offer. Well, enough for now. I'm looking forward to interacting with everyone in the Primitive Skills Group list.

My thanks to Andre for getting it set up. ---Benjamin (benjamin@perigee.net or tribe@perigee.net) -----  
 --- Matthew Rapaport Hello... Thank you to Andre for inviting me to participate. I am a classical arm-chair primitive! I enjoy a good camping adventure, and have had a fair number in my youth, but none for a decade or more now. Even these were not primitive living the likes of which our host has experienced, but rather late 20th century American style back-packing which means NOT that you use what is around you to make your way, but that you touch as little as possible! The object as much as possible is to leave the environment as untouched as possible while you pass through it. I am not a hunter, though I have fished (mostly in salt water). I know how to prepare fish and other sea food, but would like to learn to dress game, even if I don't kill it. I do enjoy shooting with fire arms, and bows however, and could hunt if I had to do it, even with a slingshot. Better I round myself out gaining some experience with traps! My real interest in bushcraft skills for now is not in wilderness living, but in living more or less comfortably though a period of normal infrastructure and service disruption in my semi-urban environment, typically as a result of some natural disaster like an earthquake! Here what is important is having stocked the right materials in the right quantities in places that survive the initial disaster. If the supermarkets are closed long enough, I may want to fall back on some food finding skills for a while... I look forward to future conversations. matthew rapaport Philosopher/Programmer at large KD6KVH mjr@crl.com In God we trust. All others we monitor! quine@dfw.net ----- Mark Bradner Hello group... I live in the Seattle, area, I've spent a large percentage of my 45 years backpacking and camping in the Pacific North West. So I guess primitive technologies have always interested me. This year I have taken up flintknapping, and I heard about your group from the knapper list server. Mark Bradner -----  
 ----- Chris Smith Hello Skills Group, a very big pleasure and opportunity to learn from and share with you all. These introductory things are always very painful for me, so I hope you don't mind me torturing myself a bit. My name's Chris Smith, I'm 48 and live in Coeur d'Alene (Core duh'Lane), Idaho, USA. That's near Canada and is a place of big lakes, rivers and forest woodland. I'm pretty happy, even when shoveling snow. I'd rather be in a hot spring than any other place on earth and that's why I live in Idaho. I still work irregardless, and have tended 'premie' babies, down to a 1/2 lb. that will fit in the palm of your hand. I'm a registered Respiratory Therapist with a perinatal/pediatric clinical specialty certification and have similar credentials for practice in Pulmonary Function Technology and Cardiopulmonary Technology. I've worked in the medical field for nearly 25 yrs, and I guess I've also worked with more knife and gunshot wound victims than most people. Not my cup of tea, anyway, my educational record is bizarre, with three 2 yr. Associate degrees and quite a few unrelated subjects. My transcripts read like: motorcycle repair, biochemistry, concrete, embryology, welding and mukluk making. If there was a degree program in Irreproducible Studies, I'd have my Masters. I've been politely and personally asked to immediately leave nice places by elk, moose, grizzly bear, rock slides, whizzing ball lightning and "the buzzing of the bee's" -- I'm not ashamed to tell you, I am trembling at the thought even now, which makes it all the harder to type. I can't rationally explain why I haven't died all the times I obviously should've, but whoever you are, I want to thank you personally - I recommend you highly to all. I've been a 60's Haight-Ashbury hippie, an American Marine with an Intelligence occupational specialty (I can't say much about that), have lived in a Zen monastery and used to be a fair rock climber. I still love my old .45 and Ka-Bar Marine knife (well, it's true) and have a warm fuzzy feeling for shotguns, ancient cultures and the wrath of nature. I like handling bullwhips and throwing knives, tomahawks and axes. I'm a member of the Wild West Arts Club, a 600 member international stunt organization. I'm not all that good, but I do play. I've wanted to learn multi-strand braiding since I was a child and through the Thrower list have begun sling braiding which covers that nicely. Kind of a sportman's paradise where I live, so if you asked me to spear you a fish, I probably could handle it. I've been fortunate to meet and sometimes care a few celebrities, including Groucho Marx, Carole King and one large hawk in particular. I have the highest respect for people like yourselves (I know what I'm talking about here) and appreciate your company and experience, which is considerable. Thanks. Chris -----  
 ----- Ted E. Bailey Hi Everybody. I just subscribed to the Primitive Skills Group today. I found Chris' introduction quite interesting. I was a Haight Ashbury hippie too and I just a year younger. Chris, did we meet in the Fillmore West over New Year's in 1968? Anyway, I am quite straight now. I even have short hair and I am an Engineering Manager. Now you know what happened to all those hippies! My favorite hobby is boomerangs and throwsticks. I got into this primitive skills stuff as a young child growing up in Panama. The first toys I wanted my Mom and Dad to buy were the blow guns and shrunken heads that the Choco Indians sold at the border towns. I used to spend all my time in the jungle learning about the native animals and surviving on my own with minimal equipment. When I was 17, I left Panama and went to Arcata California to go to college. That was the beginning of my hippy days. 10 years later, I came out of the fog with a MS degree in Mechanical Engineering and I have been stuck in a middle class rut ever since. I throw boomerangs and put out a boomerang newsletter to keep me busy. I belong to the boomerang rang\_list and the thrower email subscription group as well. I look forward to hearing more about the other subscribers. Cheers. - Ted -----  
 ----- Alexander J. Pirchl About me: I live in Austria (Europ), particularly in Kitzbuehle in the Tyrolian mountains. I am 23 years old and married now for 1 1/2 years. I have always been fascinated by \*primitiv\* technology and weapons. Since I was very small I have been toying around with knives, spears, blowguns, slingshots and slings. I also like all aspects of shooting, and own quite a number of firearms, but the power and accuracy one could get with weapons made from the simplest components have never ceased to amaze me. Survival is also a topic which I find very interesting, and the question of another member of this list stated in his introduction on what to stock up for a natural disaster would interest me very much. ----- Merv Martin Hi I'm Merv (Mervyn Martin). I was born in Red Bluff, California and lack the strip between Izmir, Turkey and Taipei, Taiwan of having been around the world. I'm ex-Navy (14 years, that's how I got to travel) and now work, when I can find it, as an Electronics Engineer in Sacramento, CA. What else, oh, I'm 45 and have just taken on two more kids, a 15 year old boy and a 12 year old girl. What a glutton for punishment (that makes five kids)!!! Ah well, I'm half adopted too and I like my step dad! I'm fascinated with anything I can do with my hands. In the past I've done well at surviving with a knife. I say well, I gained weight. I'm a pretty good trapper and only scruple at swallowing uncooked bones. They're a bit scratchy (in and out). I can't say that I've tried grubs, but Caddis Fly larvae and Helgramites aren't bad. I've fished with, but not eaten Stone Fly Larvae (Toebiters). Always wondered who'd get the most bites. Salmon eggs aren't bad either, haven't tried frog eggs. I've info that may be of use. Like how to build a rope walk (a "machine" for the manufacture of rope). I'll need to dig out the text for that, it's an old Aussie book called "Bushcraft". Wow! Primitive Skills! Anybody wanna go fishing? Hook, Spear or Trap??? BTW, the main reason I can gain weight on a survival test is that I know the area and trap! Spinning cordage would be most important to someone like me. I've used mostly grasses and 1/4 to 1/2 inch thick. This stuff usually will take a jack rabbit (1/2"). Whew, I'd better close for now! Ya'll Take Care. Looks like a great bunch of crazys here. Merv eaten\_by\_limestone@cliffhanger.com -----  
 ----- Barent Parslow Hello all, I am very pleased to be a part of this group. I am a 23 1/2 year veteran of the US Army currently serving with the Virginia National Guard and will retire in about 2 1/2 years. I am wondering if we are seeing a pattern develop here of the personality types that are interested in this subject? I was raised by both my own parents, Dad a forester and Mom a teacher and librarian, joined the Army out of high school, was a linguist working in intelligence, also served as a supply sergeant and in the infantry, was literate in Korean and Chinese, semi-literate in French, barely literate in English (especially after 5 years in Korea) and now the computer guru for my Brigade (if only they knew how little I really know). My hobbies include (when I can find the time): archery, hunting, shooting (modern and blackpowder), reloading, running

(occupational), swimming, biking, computers, reading (voraciously), history (was my Brigade's historian), and community service. I am now starting to build primitive bows (an outgrowth of my interest=20 in archery, I have been shooting since I was 10) which lead to an interest in flintknapping (led to this list by post on knappers list), which has led to interest in the subjects this list should be exploring. Many thanks for starting this list. I hope to learn alot. Also, I would like to say that I don't believe that there is such a thing as a stupid question. No questions, no answers. I should also let you know that I am a little blunt (not that blunt, did that get sent, if so I apologize) No anger, just a little too straightforward sometimes. Tactless or so some have said. Sincerely, Barent Duty, Honor, Country parslowb@CFW.COM ----- James E. Burdine I am an R.N. that works in a Surgical ICU course, but I also have past experience in the E.R. I've been interested in survival and primitive technology ever since I made my first bow from a cherry branch at the=20 age of 5 and had the same bow broken over my backside after a shot went=20 wrong. On my mother's side of the family is Hessian German, and my mother still talks about the war years and things they did to survive hard times. On=20 my father's side is Scott/Irish and Am. Indian (either Cherokee or Blackfoot depending on who you ask) So I am quite happily a mutt. My Dad tell=20 stories about the big depression, and humorous experiences from his 30 years in=20 the Army (but would not until recently talk about his experiences in the=20 Korean war) I've rubbed elbows with some of the finest survivalists in the U.S. from the Rangers, Special Forces, and Force Recon (who talked to me even though I was a leg army puke) I messed about with throwing knives, bows, firearms of various types and .38 cal blowguns. I learned to fish, and camped with the Boy Scouts. I learned how to make a warm bed in nothing=20 but a pile of leaves (pile them up, dive in gently, and wait until your body=20 heat creates a pocket of warmth) What struck me as a disadvantage about survivalism is that most people separated from their kits would not be=20 able to survive, because older methods of survival had been lost. I felt that one should be able to be dropped anywhere in the wilderness and be able=20 to scrounge up materials needed to sustain life. Thus I started reading everything I could find about primitive technology, including what I=20 call neo primitive technology. Neo-primitive technology is old techniques=20 with non-traditional materials. For example slingshots use traditional bowhunting techniques with a high tech substance (vulcanized rubber) or using steel tubing to make a blowgun. Well that's enough hot wind for=20 now. JB jburdine@PIPELINE.COM (James E. Burdine) -----

----- Russ Brownlow Hey all, I too came to this list from the KNAPPER list. My name is Russ Brownlow and I've lived in Texas my whole life. Just moved to Houston after being in Austin for 8 years. I'm pursuing a master's degree in archaeology, possibly a PhD after that. I've been involved in wilderness survival pursuits since I was a kid in Scouts. I became an Eagle Scout at 16 and have been roaming the wilderness since. I'm not a hardcore militant survivalist, but I usually work deep in the woods, so I get along OK. I haven't had to eat any bugs to survive though. I'm an archaeologist for a company out of Austin, and we do surveys, testing, etc. across the country. I wasn't around at any of the concerts you guys were talking about, but I might have been conceived at one of them early in '69. Although I'm not a true hippie, I like to think that I would've fit in well back in the day.=20 I work for an environmental firm out of Austin, TX. We do biological as well as cultural resource management type stuff. Whenever a pipeline, a transmission line, well pad, coal mine, etc. are planned, we go out and survey the area for any archaeological sites. If we find any "significant" ones, we test them. If testing proves that they are more than just the run of the mill scatters, we often excavate them. =20 Yes=20 I've found all sorts of Native artifacts, its pretty much a daily=20 occurrence when=20 we're out in the field. I also work in the lab where I do whatever has=20 to be done. =20 My main job in the lab though is the illustration of the artifacts for publication. I'm an archaeologist and an ARTaologist I guess you could say. We find lithics and pottery, but no mummies down here. We do have the occasional burial, but rarely. No signs of weaving since this area of Texas has acidic sandy soil that pretty much dissolves everything that is not rock. As for my "time travels" as an archaeologist, those hopefully lay ahead of me. I've been doing this for a while now, but only for about the past four years professionally (that is, getting paid for it). That is why I'm pursuing higher degrees, otherwise I'm relegated to being a hired shovel bum. I have run several projects, but technically I don't get the credit since the law requires a Master's degree to do so. Soon that will be taken care of. I did go to the Middle East for a while. You can find artifacts there all over the place (just walking down the road). I was chasing a herd of camels in the desert once and found an area where the wind had deflated some dunes. I found several flint cores, some pottery (that dated to around 200 B.C. from Syria), mussel shells from the ocean, and two hearths with burned bone in them. People have lived there for thousands of years so I guess it is no surprise that there are artifacts everywhere. I even found an old net weight made of stone washed up on the beach. That is about as extensive as my travels go (oh yeah, I hung out in Amsterdam for a while :]). Otherwise, I've just travelled all over Texas digging sites. As for the tribes, that is hard to say. Most of the stuff is Archaic or Paleo so we have no idea who the tribes were that far back. Of course some of the upper layers have artifacts usually associated with the Karankawa, Cherokee, Apache, depending where you're at in the state. Other than that, I'm just the young hippie type trying to make a living by having a good time out in the woods looking for stuff. It's a pretty "groovy" job. PEACE, ^/\ /\ /\ /\ Russ \ ( \_ ) ( \_\_\_\_\_ ) Russ & Rebecca Brownlow -----

----- Greg Biddle Heya all, First let me introduce myself a little. My name is Greg Biddle, I'm an archeologist, currently working in Juneau AK. I have worked all over=20 quite a bit of the western and midwestern US. I have been flintknapping for about 7-8 years and have been interested in / practicing 'primitive'=20 skills since my uncle taught me how to shoot a bow, bareback from a horse, and=20 how to cure squirrel pelts with table salt (Sorry Mom!?) I am really=20 enjoying this group, although I was getting a little worried about the 'fish bombing' thread!! -----

----- Thomas J. Elpel I am new to the primitive skills group. I can see that there is an over-abundance of e-mail already, so I will keep this as short as I can. =20 We operate Hollowtop Outdoor Primitive School (HOPS) in Pony, Montana. If you would like a brochure of our books and classes send=20 your postal address to tomelpel@3rivers.net. Mailing lists are expensive to maintain, so please ask only if you are seriously interested. Below is a promotional for one of my books: Thomas J. Elpel's Field Guide to Primitive Living Skills Primitive living is a way of learning about nature by participating in nature. Instead of merely camping in the wilderness =20 or passing through it, you can become part of the process. You discover nature by using it to meet your needs for shelter, fire, water, and=20 food. Tom's guide will give you a direct, hands-on experience of the world around you. With this book you will have the opportunity to=20 discover the thrill of staying warm and comfortable without even a blanket! Experience the magic of starting a fire by friction. Learn about the=20 edible plants of the Rocky Mountain region and the techniques to process them, plus "primitive gourmet" cooking skills. Tan the hides from your fall hunting trip, and manufacture these into durable clothing. Also covered are: primitive bows & arrows, sinews, hide glue, backpacking, felting=20 with wool, fishing by hand, stone knives, wooden containers, willow baskets, twig deer, cordage, stalking skills, trapping, and tire shoes. Thomas J. Elpel's Field Guide to Primitive Living Skills=20 includes dozens of innovative skills and 160 photographs, plus an encompassing philosophy. Tom does extensive research and development of primitive skills. He places an emphasis on publishing new information that is not found in any other source. The cost is \$17 plus \$3 priority postage. =20 Send check or money order to HOPS, Box 691, Pony, MT 59747 or use your Visa=20 or Master Card and call 406-685-3222. Watch for more of Tom's writing in these publications: The Bulletin of Primitive Technology - 2 issues per year, \$25 - Box 905=20 - Rexburg, ID 83440. BackHome - 6 issues per year - Box 70 - Hendersonville, NC 28793. Wilderness Way - 4 issues per year, \$18 - Box 203 - Lufkin, TX=20 75902-0203. The Mother Earth News - 6 issues per year - Box 56304 - Boulder, CO=20 80323-6304. =20 Always Peace, Thomas J. Elpel tomelpel@3rivers.net. ----- Wanita and Joel Sears =20 Hi, I'm Wanita Sears. Found out about this group from the knapper list. Sorry for the semi intro. It's hard to pin down my hubby, Joel for the computer other than to look at the messages. He is a knapper and spent=20 much of his boyhood in the woods learning survival skills. The

medicinal=20 plant threads interest me on this list. Wanita Sears ----- END OF LIST DEC 31 96
